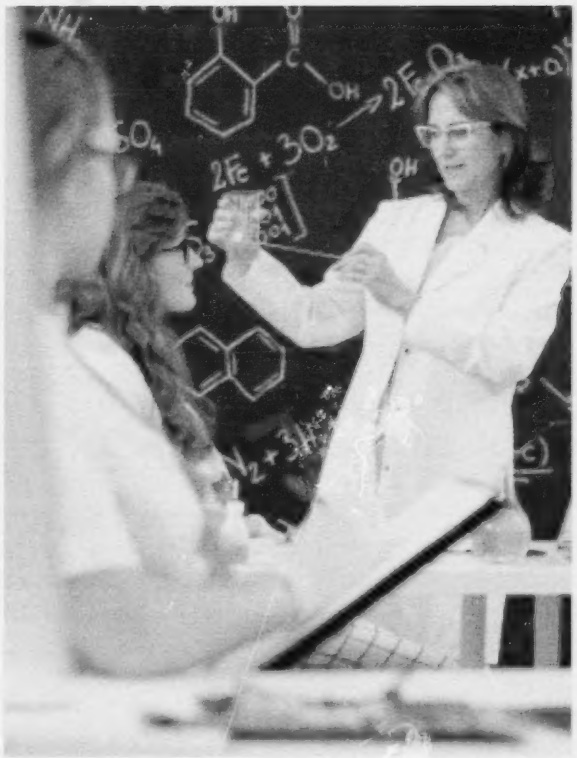
1. Executive Summary



British Columbia's high technology sector is a vital part of the province's economy. This was reinforced in 2016, when the B.C. government launched a new tech strategy, including a $100-million technology innovation fund to fuel the venture capital market in the province.[1] High technology firms tend to be innovative and efficient. They create goods and services that confer benefits on other parts of the economy by improving productivity and profitability, while at the same time providing relatively high-wage employment.

The 2016 edition of the Input Indicators of the British Columbia High Technology Sector report is prepared by BC Stats, and is the thirteenth in a series of reports first produced in 2000. This series of reports highlights some conditions affecting British Columbia's high technology sector from a supply-side perspective. This year, the report tracks the evolution of 49 business and economic climate indicators necessary for the development of the high technology sector in B.C. and provides comparisons to other provinces and Canada as a whole. The indicators cover key aspects of the educational, business, government, external, and labour sectors based on their impact on high technology firms. Included are indicators relating to the experience and labour outcomes of students graduating from high tech disciplines in British Columbia's public post-secondary institutions.

[1] See a full description of the B.C. government's #BCTECH Strategy here: https://bctechstrategy.gov.bc.ca/

The indicators in this report, which can be termed "input" measures, are chosen for their relevance and general acceptance, as well as for their availability on an ongoing basis. All indicators have been updated to the latest year for which data were available as of January 2017.[2]

Indicators of the success, or "outputs" of the high technology sector, are covered by a companion report, the *Profile of the British Columbia Technology Sector*. The Profile contains information on high technology gross domestic product (GDP), employment, wages and salaries, revenues, establishment counts and exports and imports.

The picture of British Columbia that emerges from the most recent input indicators is varied. In many areas, British Columbia compares quite favourably with other provinces, and has shown notable growth. On the other hand, performance has lagged in some areas. As such, the detailed indicators have great potential for offering tangible direction for government policies and industry growth strategies.

The indicators covered in this report span available data for the most recent reporting years and, in many cases, date back at least a decade. Where available, data are included for other provinces. Regional data for British Columbia have not been incorporated into the report, due mostly to lack of data availability and gaps in information. Similarly, international statistics have not been included, mainly because of the difficulty of making valid comparisons of indicators collected with varying definitions and against very different backdrops of social and economic organization.

[2] Some of the data come from reports, studies, and/or surveys that are only released bi-annually and, in other cases, less frequently. Every effort has been made to use the most recent data possible.

1.1 Highlights

1.1.1. Education Sector

In general, British Columbia fares quite well in performance in the education sector. B.C.'s universities have excelled in terms of technology licenses, start-up companies formed, and patents issued. The province also fares relatively well in funding for researchers in its educational institutions.

B.C. also excels in many aspects of educational attainment. However, although the province continues to have the highest percentage of the population with high school education, a rank it has held for nearly two decades, there is a deficiency with respect to the training of new graduates in some specific disciplines.

The education-based components of the B.C. government's new technology strategy, such as the addition of coding to school curricula and providing high-speed internet access to 100% of the province, could potentially have an impact on the province's educational and tech-adoption indicators in the future.

1.1.2. Business Sector

British Columbia returns above average ratings in many of the business stimulus indicators. Most notably, B.C. leads the country in per capita venture capital investment. Also, although the province's ratio of research and development (R&D) performance by business to provincial GDP remains below the national average, B.C. still holds a solid ranking of third in Canada.

Conversely, British Columbia scores below average on some other business stimulus indicators, such as patents awarded per capita.

The provincial government's strategy to boost the number of tech companies connected to foreign markets, as well as the establishment of a $100 million fund to provide local start-ups with more venture capital, has potential to improve some of these indicators in coming years.

1.1.3. Government Sector

Taxation of individuals, small businesses and corporations is more favourable in B.C. than in most other provinces. All three levels of tax rates in the province have decreased over the last decade and remain among the lowest in the country. The province also fares somewhat favourably in terms of gross expenditure on R&D as a share of GDP.

On the other hand, combined federal and provincial government performance of R&D (as a share of GDP) is lower in B.C. than in every other province.

1.1.4. External Sector

British Columbia is on par with other regions in attracting skilled foreigners in relation to its population size, although their average level of education tends to be slightly lower than in some other provinces of destination. In recent years, the province has seen a strong net inflow of people from other provinces, bolstering the supply of well-trained, educated workers. B.C. imports of high technology goods—which can be an indicator of future production, since imported components are often used to produce high tech products—have been climbing for six straight years.

The B.C. government's support for shortening the waiting period for skilled foreign workers coming to B.C. under the B.C. provincial nominee program, as well as its support for the federal government's Express Entry immigration program for workers with specialized tech skills, have the potential to impact many of these indicators in the future.

1.1.5. Labour

Unemployment rates among workers in the natural and applied sciences in B.C. remain substantially lower than for the economy as a whole. In terms of researchers per capita, British Columbia maintains a third-place standing. The province's largest city, Vancouver, remains among the most desirable places to live in the world, ranking first in the Americas for quality of life, despite its high cost of living.

1.1.6. Post-Secondary Outcomes

Results from the most recent BC Student Outcomes surveys indicate that graduates from high technology-related disciplines continued to be satisfied with their education and found that what they learned was useful in the workplace. Of those employed in high technology occupations at the time of the survey, the majority said that their educational training was relevant to their current position. Graduates working in high technology fields earned substantially more, on average, than those working in non-high technology occupations.

1.2. Indicator Summaries

An ongoing feature of this publication is the simple description of the trends in each indicator as up, down or stable (indicated in summary tables as: ↑,↓ or →). The assessment is made with regard to the trend over the span of time for which the data are available and for the latest period.[3] Also included is a comparison ranking B.C. with the provinces for each indicator. Since the previous edition (2015), the trend in some indicators has been re-evaluated, based on the latest information. Table 1 provides a quick summary of trends and rankings for each indicator. Summary results for each sector are presented at the start of each section in the body of the report. More detailed statistical information is contained in the tables in the Appendix.

TABLE 1. QUICK SUMMARY OF INDICATORS

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
EDUCATION SECTOR			
E-1: Percentage of population with a high school diploma	↑	↑	1 of 10
E-2: Percentage of pop. with post-secondary credentials	↑	↑	5 of 10
E-3: 13 year-old student achievement in science	↑	↑	3 of 10
13 year-old student achievement in math		↑	5 of 10
E-4: Total bachelor degrees awarded per 100,000 persons	↑	↑	4 of 10
E-5: Total graduate degrees awarded per 100,000 persons	↑	↓	7 of 10
E-6: Bachelor degrees awarded in engineering*	↑	↑	8 of 10
E-7: Bachelor degrees awarded in computer science*	↓	↑	2 of 10
E-8: Bachelor degrees awarded in physical & life science*	↑	↑	6 of 10
E-9: Percentage of households using the Internet	↑	↑	2 of 10
E-10: Income from technology licenses at U-15 universities†	↓	↑	2 of 15
E-11: U.S. patents issued to U-15 universities‡		↓	4 of 7
E-12: University start-up companies formed‡	↑	↑	3 of 7
E-13: Higher education performance of R&D (HERD) to GDP		↓	7 of 10
E-14: Per capita grants and awards funded by CIHR	n/a	n/a	3 of 10
E-15: Per capita projects funded by CFI: Health	n/a	n/a	4 of 10
E-16: NSERC grant & scholarship expenditures	n/a	n/a	3 of 10
E-17: Canada Research Chairs	n/a	n/a	3 of 10

[3] Note that the fact an indicator may be rising in relation to other provinces does not necessarily indicate an advantage for British Columbia. For example, above average taxes would normally be viewed as a negative indicator from the point of view of the high technology sector. For this purpose, the summary arrows are colour-coded to indicate positive (green), neutral (yellow) or negative (red) trends.

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
BUSINESS SECTOR			
B-1: Patents per 100,000 persons	↑	↑	6 of 10
B-2: Patents granted as a % of applications, 3 year average	↑	↑	8 of 10
B-3: Entries to the high tech sector	↑	↓	n/a
B-4: Exits from the high tech sector	↑	↓	n/a
B-5: High growth high tech companies	↑	↑	n/a
B-6: Venture capital investment, per capita	n/a	n/a	1 of 10
B-7: Venture capital investment: share of Canadian total	n/a	n/a	3 of 10
B-8: Business expenditure on R&D (BERD) to GDP	↓	→	3 of 10
GOVERNMENT SECTOR			
G-1: Personal tax index individual with $80,000 income	↓	↓	1 of 10
G-2: Small business tax rate	→	→	3 of 10
G-3: Corporate income tax rate	→	→	2 of 10
G-4: Government expenditure on R&D (GOVERD) to GDP	→	↑	10 of 10
G-5: Gross expenditure on R&D (GERD) to GDP	→	↓	4 of 10
EXTERNAL SECTOR			
X-1: Percentage of immigrants with 16+ years of education	→	↓	4 of 10
X-2: Median years of schooling of immigrants	→	↓	6 of 10
X-3: Net inter-provincial migration	↑	↑	1 of 10
X-4: High technology imports	↑	↑	n/a
LABOUR			
L-1: Unemployment rate for natural and applied sciences	→	↓	2 of 10
L-2: Research personnel per 100,000 population	↑	↓	3 of 10
L-3: Quality of life, Vancouver[∞]	↓	→	5 of 221
L-4: Cost of living[×]	→	↑	10 of 11

Note: Ranking is across the ten provinces unless otherwise indicated in the following footnotes.

* The tables for these indicators are split into part (a) for Bachelor degrees and part (b) for Graduate degrees. Data for degree area of engineering include architecture, engineering and related technologies; data for degree area of computer science include mathematics, computer and information sciences. Ranking is measured on a per capita (per 100,000 persons) basis.

† The ranking compares UBC to all U-15 universities.

‡ This indicator is a sum of the U-15 universities. The ranking is out of 7 because only 7 provinces have U-15 universities.

∞ The ranking compares Vancouver to 221 cities worldwide.

× The ranking compares Vancouver to 10 other Canadian cities.

INDICATORS	Trend for Diploma & Certificate Grads		Trend for Baccalaureate Grads		Ranking
	Long-Term	Latest Year	Long-Term	Latest Year	Overall
POST-SECONDARY OUTCOMES					
O-1: Satisfaction with education*	→	↓	→	→	n/a
O-2: Quality of instruction*	→	→	→	→	n/a
O-3: Further studies since graduation*	→	→	↓	→	n/a
O-4: In the labour force*	→	→	→	→	n/a
O-5: Employment rate*	→	→	→	↑	n/a
O-6: Unemployment rate*	→	→	→	↓	n/a
O-7: Knowledge, skills & abilities useful in job*	→	→	→	→	n/a
O-8 Employed in high technology occupation~	→	→	↑	→	n/a
O-9: Job related to training^	→	→	↓	→	n/a
O-10: Full-time employment^	→	→	→	↓	n/a
O-12: Median income (hourly for DACSO, annual for BGS)	↑	→	↑	↑	n/a

Post-Secondary Outcomes are from BC Student Outcomes surveys. Note that the surveys are for British Columbia only and, therefore, provincial comparisons are not available. Indicators above are based on five years of respondent data from two surveys: the Baccalaureate Graduates Survey (BGS) and the Diploma, Associate Degree, and Certificate Student Outcomes (DACSO) Survey. Respondent ratings of education are consistently high and any decline showing is modest.

* Respondents who took high technology programs.

~ On the DACSO Survey, quality of instruction was asked using a 5-point scale: very good, good, adequate, poor, and very poor. Percentages presented for DACSO quality of instruction include very good, good, and adequate. On the BGS Survey, quality of instruction was asked using a 4-point scale: very good, good, poor, and very poor. Percentages presented for BGS quality of instruction include very good and good.

≈ Employed in high technology occupation as a percentage of all employed respondents.

^ Of those respondents who indicated they were employed in a high technology occupation.

2. Introduction

2.1. Background

Although industry has been knowledge- and technology-based throughout history, information as a driver of economic growth has grown dramatically in importance over the last quarter-century. Global and local economies alike are now far more dependent on the production, dissemination and use of knowledge. High technology industries rely heavily on knowledge as a primary input. As such, these industries are obvious starting points for measuring the impact of new knowledge-based technologies on economies.

In 2000, BC Stats released the first edition of *British Columbia High Technology Input Indicators: The 1990s*. The purpose of the report was to monitor the high technology sector from the input side, by measuring and analyzing the production and application of knowledge, and the climate, institutions and funding arrangements that make this knowledge available for the development of the provincial high technology sector. The report has been updated regularly since then, this being the thirteenth edition.

A companion report, *Profile of the British Columbia Technology Sector*,[4] has been produced by BC Stats regularly since 1994. The profile focuses on measures of gross domestic product (GDP), employment, wages and salaries, revenues, establishments, and exports and imports. Such measures could be referred to as the outputs of the high technology sector and the profile provides a broader overview of where B.C.'s high technology sector has been and where it might be heading.

While there is obvious value in monitoring the "output" of the high technology sector, information about the processes that give rise to that output is also of key importance, both for potential investors interested in the province's business and tech environment, and for policy-makers who require this data to make informed policy decisions. In fact, the high technology sector and the surrounding ecosystem are complex, with many players and interactions. Understanding this system is a matter of identifying the various parts and collecting information that shows how these parts behave and interact over time. For a more detailed description of the high technology "system," see Appendix I. A list of industries that are included in the high tech sector is available in Appendix II.

Information on the high technology system can help show the best ways to promote growth in the sector. This may include assistance to parts of the system that are only indirectly linked to actual production. For example, improvements to the secondary school system may seem very different from output subsidies or tax cuts for high technology firms, but both may have the effect of promoting growth in the high technology sector in the long term. Good information provides policy makers with the tools to assess the current situation, as well as an indication of where more effort may be needed to provide an environment in which high technology and other knowledge-based industries can thrive.

[4] Available at www.bcstats.gov.bc.ca.

2.2. Comparison with Other Jurisdictions

Wherever possible, the indicators selected for this publication use comparisons to other provinces and show the range of what is possible, or what has been achieved, in the high technology sector within a Canadian context. The publication focuses on trends in British Columbia as they compare to those in other provinces.

2.3. The "Quick Summary" Tables

The indicators selected for this publication represent only a fraction of the information base that is available for the high technology sector. However, even this number of indicators measured over time and across provinces poses a challenge to readers looking for an overview of the current situation and an indication of which areas warrant further study. To meet this challenge, this report is first divided according to the "sectors" outlined in the model diagram (see Appendix I). Each of the resulting sections covers a number of individual indicators.

The summary makes use of up, down and horizontal arrows (↑,↓,→) to show whether the indicator has risen, dropped or remained relatively stable. The assessment is made with regard to the trend over the span of time for which the indicator is available and for the latest period. The summary arrows are colour-coded to indicate positive (green), neutral (yellow) or negative (red) trends. Wherever possible, British Columbia is also ranked against other provinces for each indicator.

Since the arrow indicators show only the direction of change, the summary report doesn't indicate the size of changes or their detailed pattern over time. This information is found in the graphs and text included in each section. More comprehensive data tables for each indicator are located in Appendix III.

Some indicators are not available as a time series; however, they provide information that better reveals the big picture with regard to the condition of high technology in British Columbia and in other parts of the country. Although included in the Quick Summary tables for reference purposes, these indicators do not have corresponding arrow symbols, but are instead marked with 'n/a', where comparisons over time or to other regions are not possible.

3. Educational Indicators

The educational sector provides inputs to high technology firms in three ways:

1. When individuals acquire skills and knowledge required for product development and production
2. During the commercialization of research performed in the educational sector
3. Funding and performance in research and development

The indicators listed below are measures of these roles. Many are presented on a per capita basis (expressed as rates per 100,000 population where per capita figures are quite small), as regional shares of national totals, or as a share of gross domestic product (GDP) to allow meaningful comparison with other provinces.

TABLE 2. QUICK SUMMARY OF INDICATORS FOR THE EDUCATION SECTOR

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	**Overall**
E-1: Percentage of population with a high school diploma	↑	↑	1 of 10
E-2: Percentage of population with post-secondary credentials	↑	↑	5 of 10
E-3: 13 year-old student achievement in science	↑	↑	3 of 10
13 year-old student achievement in math	→	↑	5 of 10
E-4: Total bachelor degrees awarded per 100,000 persons	↑	↑	4 of 10
E-5: Total graduate degrees awarded per 100,000 persons	↑	↓	7 of 10
E-6: Bachelor degrees awarded in engineering*	↑	↑	8 of 10

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
E-7: Bachelor degrees awarded in computer science*	↓	↑	2 of 10
E-8: Bachelor degrees awarded in physical & life science*	↑	↑	6 of 10
E-9: Percentage of households using the Internet	↑	↑	2 of 10
E-10: Income from technology licenses at U-15 universities†	↓	↑	2 of 15
E-11: U.S. patents issued to U-15 universities‡	→	↓	4 of 7
E-12: University start-up companies formed‡	↑	↑	3 of 7
E-13: Higher education performance of R&D (HERD) to GDP	→	↓	7 of 10
E-14: Per capita grants and awards funded by CIHR	n/a	n/a	3 of 10
E-15: Per capita projects funded by CFI: Health	n/a	n/a	4 of 10
E-16: NSERC grant & scholarship expenditures	n/a	n/a	3 of 10
E-17: Canada Research Chairs	n/a	n/a	3 of 10

* The tables for these indicators are split into part (a) for Bachelor degrees and part (b) for Graduate degrees. Data for degree area of engineering include architecture, engineering and related technologies; data for degree area of computer science include mathematics, computer and information sciences.

† The ranking compares UBC to all U-15 universities.

‡ This indicator is a sum of the U-15 universities. The ranking is out of 7 because only seven provinces have U-15 universities.

Historically, British Columbia's general population has had particularly strong educational attainment. Data for the most recent reporting year show that the province continues to boast the highest percentage of its population with a high school education. Despite the high proportion of high school graduates, B.C. exhibits somewhat of a deficiency with respect to the training of new graduates in some specific tech-related disciplines. Similarly, the provincial ratio of higher education research and development (R&D) to GDP is low when compared to national standards. Nevertheless, in terms of providing a hospitable landscape for innovation in scientific research, B.C. presents itself relatively well.

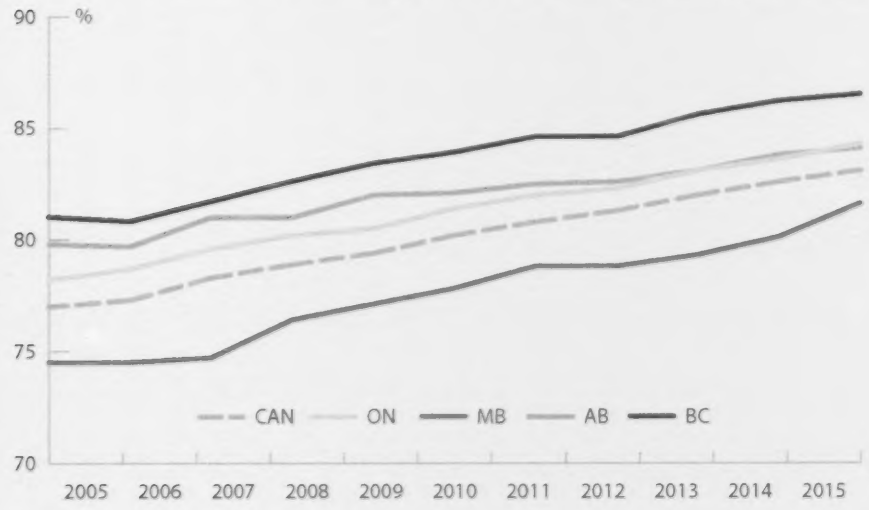
3.1. Educational Attainment

Higher levels of educational attainment enable high technology firms to draw from a broader, more highly-developed skill base. Higher levels of educational attainment also suggest a more knowledgeable population that is better able to understand and participate in the complexity of the high technology economy.

As in other parts of the country, the overall trend for B.C. is that more British Columbians are completing high school and continuing their education to obtain post-secondary credentials. Four indicators of educational attainment—the percentage of the population aged 15 and older with a high school diploma, the percentage with post-secondary credentials, and the ratios of bachelor and graduate degrees awarded in the provinces—have all shown steady increases across Canada over the past decade.

At 87% in 2015, B.C. remained ahead of the rest of Canada with the highest percentage of its population having a high school diploma. The province has recorded the highest percentage since at least 1990, when 72% of its population aged 15 and over had graduated from high school, compared to the national average of 64%. However, the gap between B.C. and the other high technology provinces has gradually narrowed over the past decades, such that by 2015, the share of B.C.'s population with a high school diploma was less than four percentage points higher than the Canadian average (83%).

INDICATOR E-1: PERCENTAGE OF THE POPULATION 15 YEARS AND OLDER WITH A HIGH SCHOOL DIPLOMA

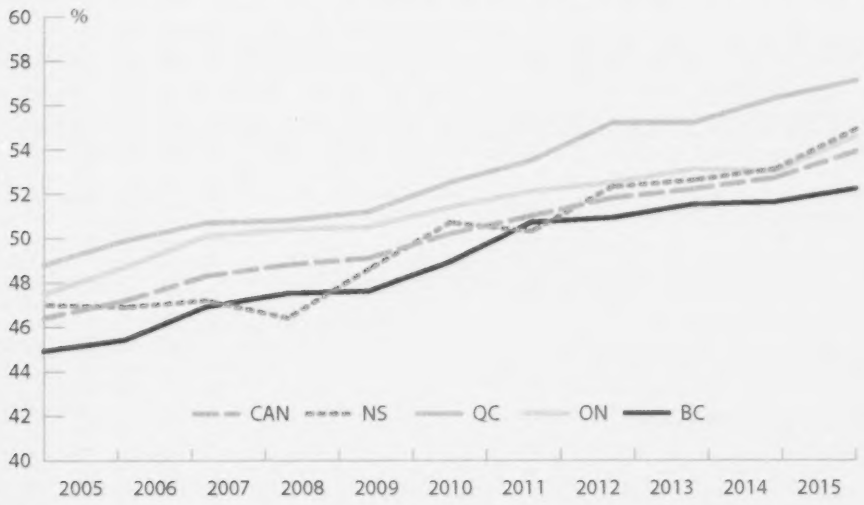


B.C. leads the country in share of population with a high school diploma.

Data source: Statistics Canada

Along with the rest of the country, British Columbia continues to improve its post-secondary achievement and the gaps in proportion of population with post-secondary credentials among the provinces are relatively small. At 52% in 2015, B.C.'s rate was slightly below that of the national average (54%), while Quebec had the highest rate (57%), and Manitoba and Saskatchewan (each 46%) continued to score below the rest of the country.

INDICATOR E-2: PERCENTAGE OF THE POPULATION 15 YEARS AND OLDER WITH POST-SECONDARY CREDENTIALS



The percentage of B.C.'s population with post-secondary credentials continues to climb and remains close to the national average.

Data source: Statistics Canada

3.2. Achievement on Canadian Standardized Tests

Standardized testing offers a comparable nation-wide measure for the demonstrated skills and knowledge of thirteen-year-old students. School programs differ from one part of the country to another, so making comparisons of results from these various programs is a complex task. However, young Canadians in different provinces and territories learn many similar skills in mathematics and science.[5]

For the purposes of the Pan-Canadian Assessment Program (PCAP), three competencies are associated with demonstrating scientific literacy among thirteen-year-olds: science inquiry, problem solving, and decision making. Each of these competencies requires an understanding of the nature of science, applying relevant scientific knowledge, using skills and demonstrating attitudes as a reflection of scientific literacy.

Mathematics curricula within the various Canadian jurisdictions are similarly structured and based on a number of mathematical processes deemed essential to the effective study of the subject. These generally include problem solving, reasoning and justifying thinking, reflecting, using appropriate tools and computational strategies, making connections within and outside the discipline, and representing and communicating mathematically.

[5] The School Achievement Indicators Program (SAIP) was a cyclical program of pan-Canadian assessments of student achievement in mathematics, reading and writing, and science that was conducted by the Council of Ministers of Education, Canada (CMEC) between 1993 and 2004. The Pan-Canadian Assessment Program (PCAP) has since replaced SAIP, with its first assessment conducted in the spring of 2007 and the first report released in the spring of 2008. PCAP is administered every three years. The Pan-Canadian Assessment Program evaluations help to determine whether students across Canada reach similar levels of performance at about the same age. Students' total scores in each subject area are transformed onto a common scale, ranging from 0 to 1000, with the average for the pan-Canadian population set at 500. Since this is a new assessment program, 2007 and 2010 are the only reporting years for which data has been released to date. Also, the only age-group measured thus far is 13 year-old students. As a result, the scores reflect a mere snap-shot of the provincial standing in standardized tests. It remains to be seen, as the program progresses and further data are collected, how the provinces fare in terms of improvements or changes on a comparative and time-series basis.

In 2013 (the most recent year for which data are available), the mean scores in science for thirteen-year-old students in Alberta (521) and Ontario (511) were much higher than those obtained by Canadian students overall (500) and B.C. students ranked third (mean of 501) in the country. Students in New Brunswick (469) and Manitoba (465) scored the lowest.

INDICATOR E-3 (A): CANADA-WIDE RANK OF 13 YEAR-OLD ACHIEVEMENT IN SCIENCE (MEAN SCORES)

	2010	2010 rank	2013	2013 rank
Alberta	515	1	521	1
Ontario	510	2	511	2
British Columbia	**497**	**3**	**501**	**3**
Newfoundland and Labrador	487	7	500	4
Nova Scotia	489	5	492	5
Prince Edward Island	493	4	491	6
Saskatchewan	488	6	486	7
Quebec	486	9	485	8
New Brunswick	487	7	469	9
Manitoba	486	9	465	10
Canada	500	n/a	500	n/a

Data source: Council of Ministers of Education, Canada

Since 2013, students in Quebec ranked first among the nation's regions in achievement in mathematics, with a mean score of 527, followed by Ontario (512) and Alberta (502). British Columbian students ranked fifth in the country (489), 18 points below the Canadian mean (507).

INDICATOR E-3 (B): CANADA-WIDE RANK OF 13 YEAR-OLD ACHIEVEMENT IN MATHEMATICS (MEAN SCORES)

	2010	2010 rank	2013	2013 rank
Quebec	515	1	527	1
Ontario	507	2	512	2

Data source: Council of Ministers of Education, Canada

3.3. Degrees Awarded

In a healthy economy, local industry provides jobs and the community provides the workforce to sustain the growth of the economy. Jobs in the high technology industry require specialized skills training. The number of degrees awarded within a given population is directly indicative of the potential human resources available to the province. Focusing on the degrees awarded on a per capita basis provides some indication of the overall education level of the province and the ability of the high tech sector to use these educated individuals.[6]

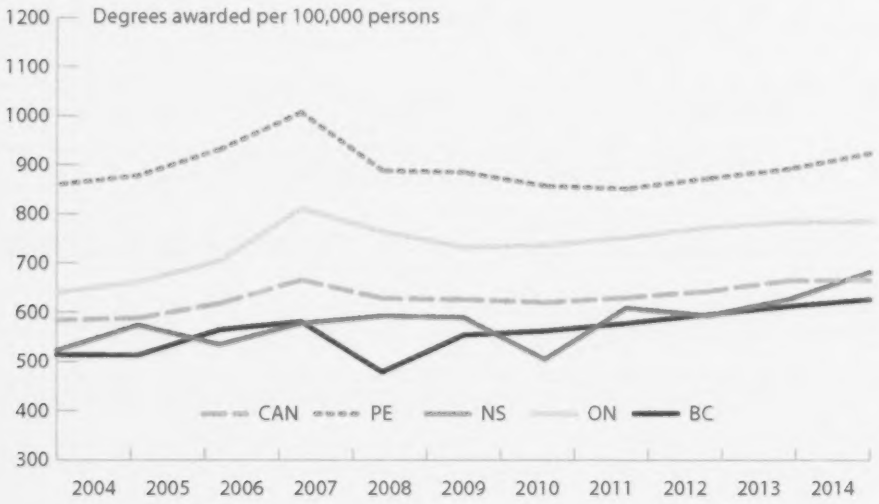
The likely presence of skilled and educated professionals in a high technology economy is indicated by the number of graduates per capita who hold undergraduate and graduate degrees.

The province has recently shown improvements in terms of degrees granted per 100,000 persons, such that it ranks fourth among the provinces. In 2014, the number of bachelor degrees awarded per 100,000 people in the province climbed 2.3% over 2013, pushing the province's ratio notably higher (625, up from 611 in 2013). B.C. also presents itself favourably in absolute terms, awarding

[6] It is equally important to acknowledge the number of degrees awarded in absolute numbers. This is an indicator of the size of the domestic labour pool available from which high technology firms can draw and, ultimately, whether a province has sufficient qualified people to support an industry. Engineers, computer and information scientists, and physical and life scientists are driving forces behind the high technology sector. They provide a highly specialized form of labour that is integral to research and development. Looking at how well B.C.'s universities are doing to meet workforce demand and the interest in technology-related careers provides some measure of the province's capacity to supply the high tech economy. The geographical availability of people trained in these fields lowers the search costs for firms that demand these skills. Furthermore, individuals educated in such fields are often engaged in the design and integration of new technologies into a firm's business model.

the third highest number of degrees in the country. In 2014, the province's universities granted 24,798 undergraduate degrees, significantly more than in neighbouring Alberta (19,842).[7]

INDICATOR E-4: TOTAL BACHELOR DEGREES AWARDED PER 100,000 PERSONS AGED 15 YEARS AND OLDER



In 2014, B.C. awarded more bachelor degrees per capita than any other western province.

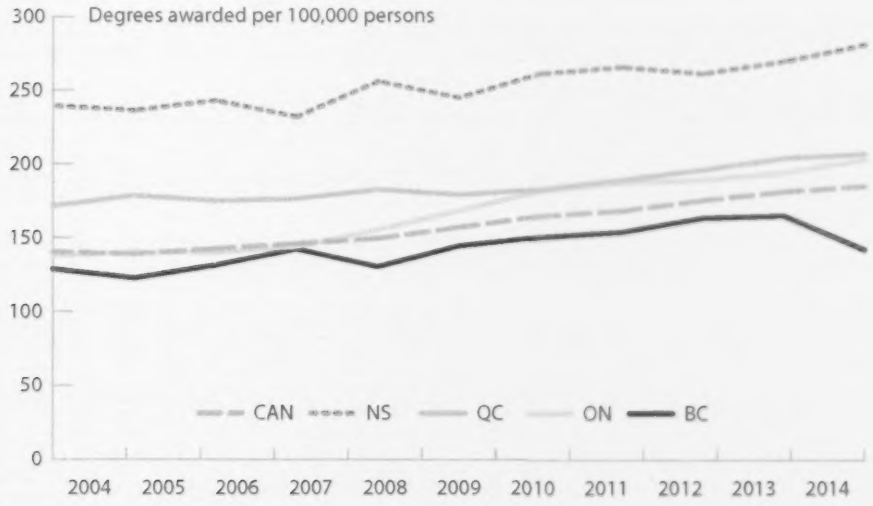
Data source: Statistics Canada

Over the past decade, B.C. has also seen an upswing in the number of masters' and doctorate degrees granted, from 4,443 in 2004 to 5,628 in 2014. This solid increase has allowed B.C. to retain a third-place ranking among the provinces.

[7] It is important to note that measuring the number of degrees awarded by British Columbia's institutions does not only measure degrees awarded to British Columbians. As such, this is not a perfect measure of the overall educational level of the population of British Columbia. Given the fact that students travel to various locations to pursue a post-secondary education, it is extremely difficult to measure how many British Columbians acquire a specific degree in a given year, and it is not feasible to know whether they return to B.C. after completing a degree elsewhere. Nonetheless, much of the student-body who attend the province's universities are, in fact, permanent residents of B.C. and the number of degrees granted by B.C.'s institutions is a direct indicator of the expertise of the labour pool available to the high technology sector regardless of where a student comes from. The number of degrees granted in B.C. is also an indicator of the appeal of the province's higher-education institutes and how many students from other provinces and around the world choose to pursue an education in British Columbia. Using a per capita calculation is a better gauge of B.C.'s performance in degree granting relative to other provinces.

In terms of graduate degrees per capita, Nova Scotia (281 degrees per 100,000 persons in 2014) has continuously outpaced the rest of the country over the past ten years. B.C. institutions awarded 142 graduate degrees per 100,000 persons in 2014, considerably below the Canadian average (185).

INDICATOR E-5: TOTAL GRADUATE DEGREES AWARDED PER 100,000 PERSONS AGED 15 YEARS AND OLDER

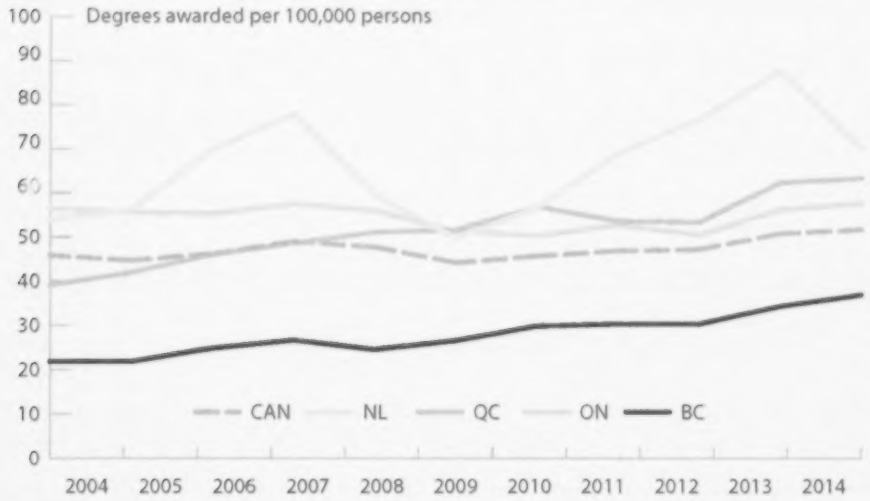


Data source: Statistics Canada

The actual number of graduate degrees awarded per year in B.C. has climbed considerably over the past decade, but the number of graduate degrees awarded per capita remains below the Canadian average.

Among some specific disciplines, British Columbia has tended to lag other provinces in undergraduate and graduate degrees awarded per year, and 2014 was no exception. In that year, on a per capita basis, the province ranked eighth in the number of undergraduate degrees awarded to students of architecture, engineering and related technologies, and seventh in number of graduate degrees. However, in actual numbers, the province has seen a noteworthy increase in graduates (of all levels) from this field over the past decade.

INDICATOR E-6: BACHELOR DEGREES AWARDED IN ARCHITECTURE, ENGINEERING AND RELATED TECHNOLOGIES PER 100,000 PERSONS AGED 15 AND OLDER

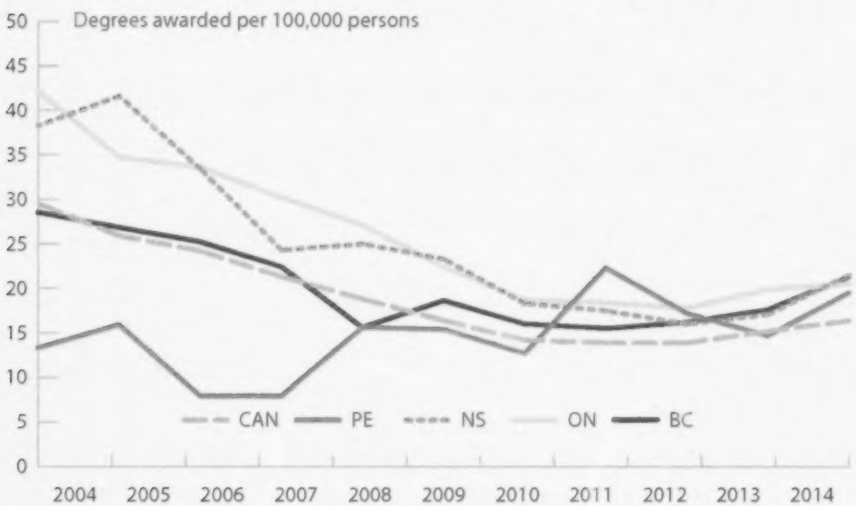


B.C. ranks eighth among the provinces in architecture and engineering bachelor degrees awarded per capita.

Data source: Statistics Canada

British Columbia fares much more favourably in the per capita ratio of undergraduate degrees awarded in the area of mathematics, computer and information sciences. B.C.'s ratio (21 degrees per 100,000 persons in 2014) ranks second among the provinces, and well above the Canadian average (16).

INDICATOR E-7: BACHELOR DEGREES AWARDED IN MATHEMATICS, COMPUTER AND INFORMATION SCIENCES PER 100,000 PERSONS AGED 15 YEARS AND OLDER



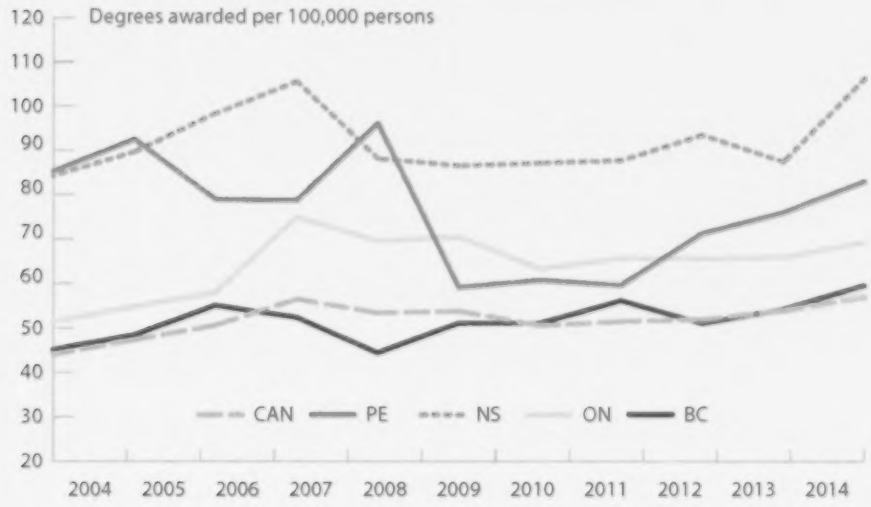
B.C. shows strength in bachelor degrees awarded per capita in math, computer and information sciences, despite a general downward trend across the country over the past decade.

Data source: Statistics Canada

In terms of graduate degrees awarded per 100,000 persons in this group of disciplines, B.C. (seven per 100,000 persons) ranked sixth among the provinces in 2014.

At 60 per 100,000 persons in 2014, the number of B.C. graduates with a bachelor degree in the area of physical and life sciences and technologies was above the Canadian average (57), but ranked just sixth among the provinces.

INDICATOR E-8 BACHELOR DEGREES AWARDED IN PHYSICAL AND LIFE SCIENCES AND TECHNOLOGIES PER 100,000 PERSONS AGED 15 YEARS AND OLDER



Per capita degrees awarded annually in physical and life sciences and technologies are slightly above average in B.C.

Data source: Statistics Canada

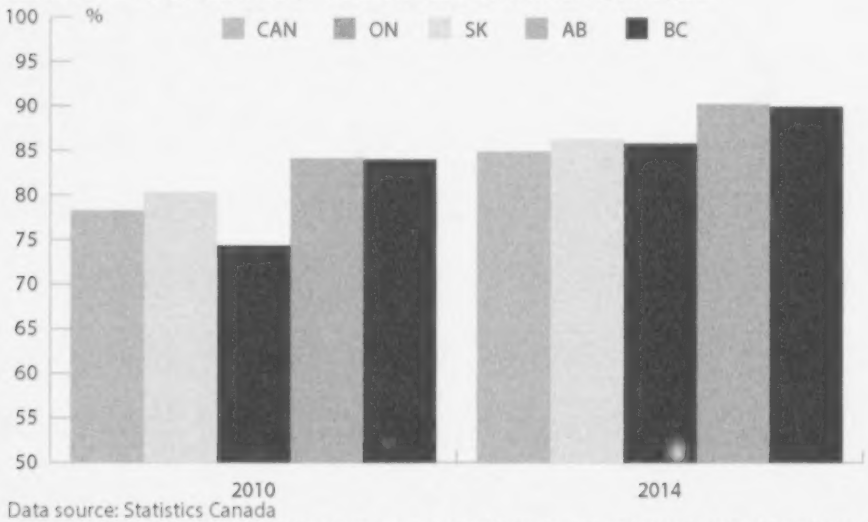
In 2014, British Columbia awarded 10 graduate level degrees per 100,000 persons in physical and life sciences and technologies, below the Canadian average (16 per 100,000 persons).

3.4. Access to Technology and Technology Adoption

Technology companies are attracted to locations where high speed internet is available and reliable. Target markets for technology companies tend to include locales where the population and businesses lean toward higher rates of technology adoption. The rate of technology adoption is an indicator of the willingness of the population to employ the advantages afforded by high technology. Greater familiarity with technology within the population is likely to strengthen local market demand for high tech goods and services. Also, the acceptance of internet and e-business technologies means small businesses participating in the application economy can reach a world-wide market, reduce the time and cost per transaction and eliminate much of the capital investment required in typical operations.

With increased globalization, and the rising popularity of new and innovative forms of communication, Canadians continue to make greater use of new information technologies at home and in the workplace. In fact, Canada has almost reached the point of saturation in terms of home internet access. Nonetheless, British Columbia continues to lead the country in percentage of households with internet access from home (90%), well above the Canadian average (85%) in 2014.

INDICATOR E-9: PERCENTAGE OF HOUSEHOLDS WITH INTERNET ACCESS

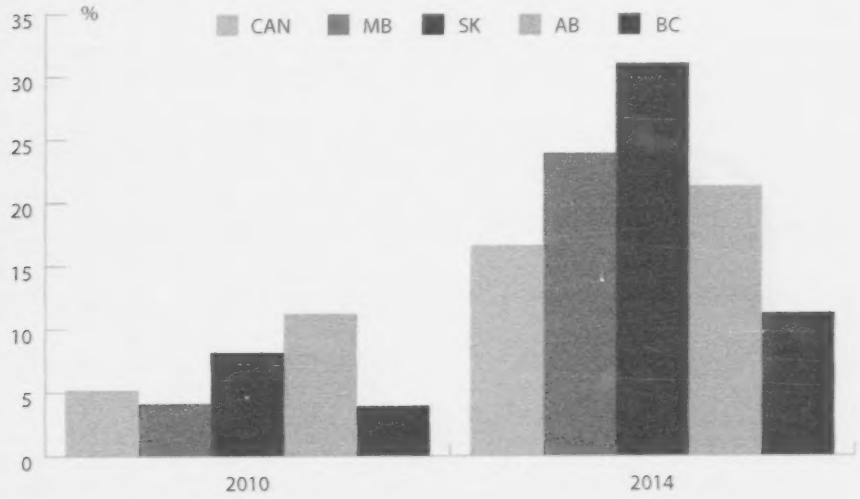


Data source: Statistics Canada

Alberta and B.C. have a larger share of households with internet access than other provinces.

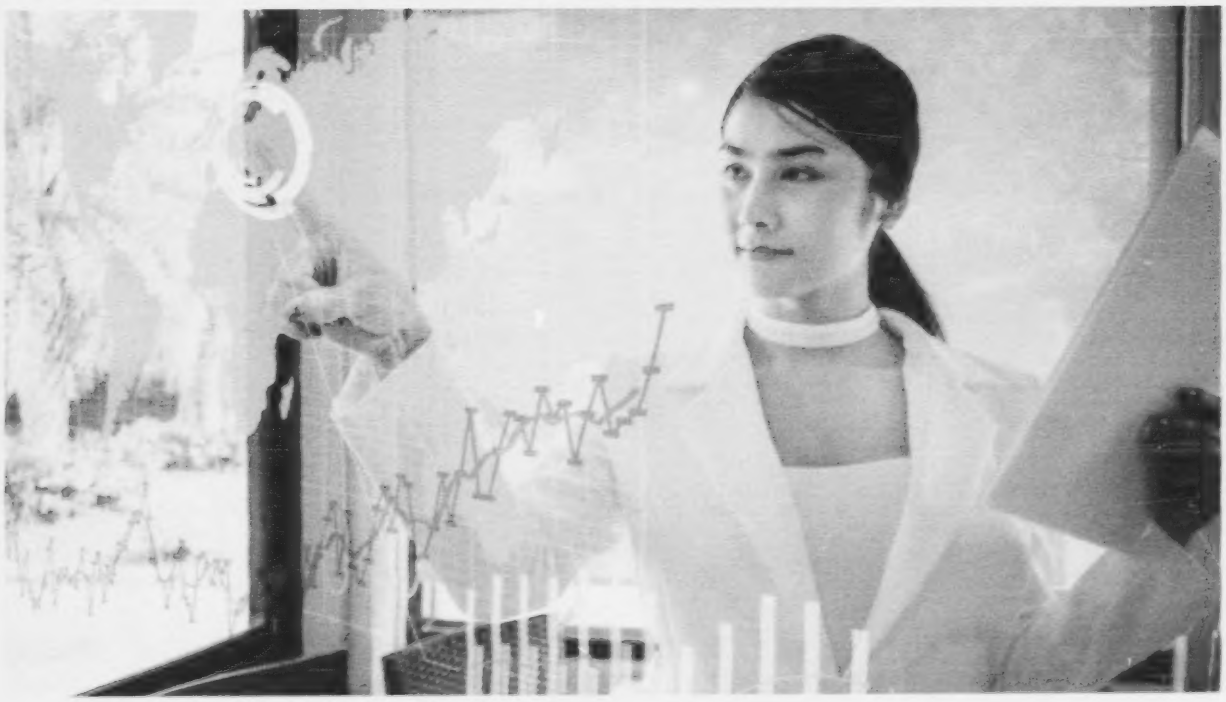
Conversely, Wi-Fi connections at home appear to be slightly less common in British Columbia (11% in 2014) than in Canada as a whole (17%). In 2014, household wireless connectivity was most popular in Saskatchewan (31%).

PERCENTAGE OF HOUSEHOLDS WITH WI-FI INTERNET AT HOME



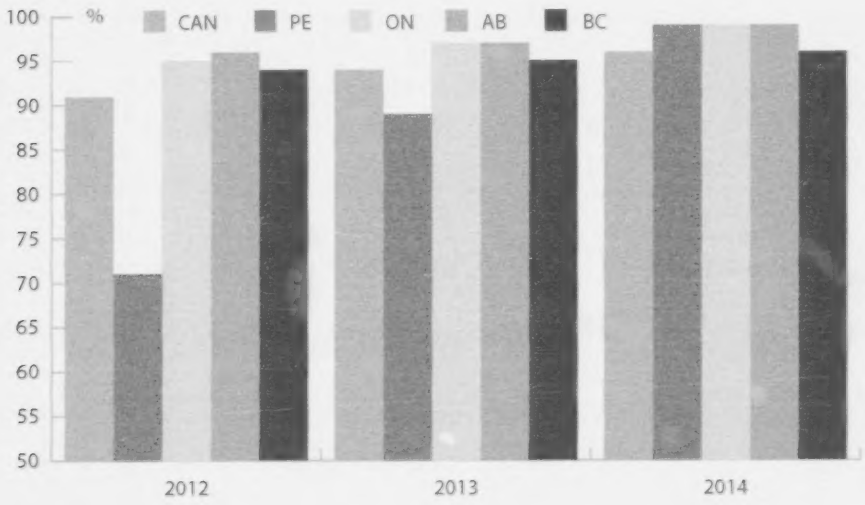
Wi-Fi Internet usage has surged in recent years.

Data source: Statistics Canada



The availability of very high speed internet (i.e., broadband internet with download speeds of 5 Mbps or higher) is important to technology firms wanting to locate in a particular region and, until recently, B.C. was ahead of the curve with a higher percentage of households in the province having access to such technology, compared to the Canadian average. However, access has improved across the country and in 2014 B.C. had the same proportion of households with access as the national average (96%). In 2014, Ontario, Alberta and Prince Edward Island were the only provinces with higher rates of access (each with 99%).

PERCENTAGE OF HOUSEHOLDS WITH ACCESS TO BROADBAND INTERNET SERVICE WITH SPEEDS OF 5 MBPS OR HIGHER



Around 96% of B.C. households have access to broadband Internet service with speeds of 5 Mbps or higher.

Data source: Industry Canada and CRTC

3.5. Technology Licensing

University faculty members are at the forefront of research and their work often involves partnerships with the private sector for either expertise or equipment. This collaboration has many outcomes, including grants, contribution agreements and negotiated contracts whereby the institution and the researcher share in the payoffs. One way of measuring successful collaboration and research productivity is through university technology licenses. These licenses allow the institution to 'spin-off' the commercial aspect of the researcher's discovery, which provides income. The number of U.S. patents issued to Canadian institutions and the creation of university start-up companies are also important indicators of future revenues.[8]

In the mid-1980s, universities across Canada began opening industry liaison offices. These offices are primarily responsible for negotiating research and development collaborations with businesses and public and private organizations. They also work to ensure the protection of research work developed at the university, especially that with commercial potential. These offices work with industry to spin-off technologies developed at the university into successful start-up companies.

[8] As a caution, one must keep in mind that a key purpose of universities is to conduct "primary" research—work that does not have any immediate commercial application. This work, when successful, becomes the foundation of further applied research and development. A good example is the Human Genome Project, which recently completed mapping out the genetic structure of the human being. Thus, licensing only provides a partial view of the importance of university research in the high tech sector.

Due in part to the volatile nature of innovative research, there has been a great deal of shuffling of ranks among Canada's major U-15[9] universities over the past decade. However, B.C.'s largest university has a history of pulling in more income from technology licensing than most other Canadian universities.

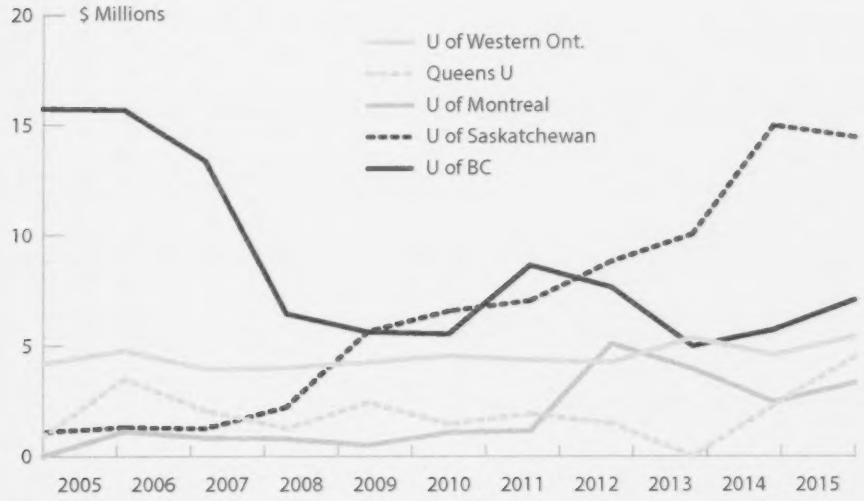
With a gross income of over $7.0 million from technology licences in 2015, the University of British Columbia was ahead of all but one of the country's other top research universities in technology licensing. The University of Saskatchewan ranked first, with $14.4 million in income from technology licensing.

Looking at the income per license provides a picture of the commercial success of the research. In 2015, UBC was also a leader in the number of licenses yielding income (111), but was below several other universities in terms of the average gross income per technology license ($64,000).

UBC is not the only university in the province to show promise in technology licensing in recent years. Although not classified as U-15 universities, Simon Fraser University (SFU) and the University of Victoria (UVic) have also made strides. In 2015, SFU received a gross income of $808,000 from technology licenses, while UVic received $543,000. SFU yielded an average of $115,000 per technology license in 2014, notably higher than UVic's average ($60,000).

[9] 'U-15' Universities are the leading research universities in Canada and originally included the following institutions as part of the 'G-10' group: University of British Columbia (B.C.), University of Alberta (Alberta), University of Toronto (Ontario), Queens University (Ontario), University of Waterloo (Ontario), McMaster University (Ontario), University of Western Ontario (Ontario), Université de Montréal (Quebec), McGill University (Quebec), and Université Laval (Quebec). As of 2006, three more universities were added to the group, expanding it from 10 institutions to 13. The three universities added were: University of Calgary (Alberta), Dalhousie University (Nova Scotia) and University of Ottawa (Ontario). In 2011, a further two institutions were added (University of Manitoba and University of Saskatchewan) and the group was renamed 'U-15.' The data for these and some other universities do not go back as far as the original ten. Note also that there are some other Canadian institutions that are highly active in technology research, but are not members of the U-15 group and, as such, are not included in this analysis.

INDICATOR E-10: GROSS INCOME FROM TECHNOLOGY LICENSES (IN MILLIONS OF $CDN) AT TOP-PERFORMING U-15 UNIVERSITIES



Licensing income at UBC is on the rise and remains above most other leading Canadian institutions.

Data source: Association of University Technology Managers

Over the past decade, British Columbia has consistently shown strong results in terms of the number of U.S. patents awarded to its top research institution (UBC). Acquiring a cumulative 102 patents between 2011 and 2015, B.C. ranked fourth among the provinces in the number of patents granted in the last five reporting years. Over the same period, Ontario (295) led the pack, followed by Quebec (239).

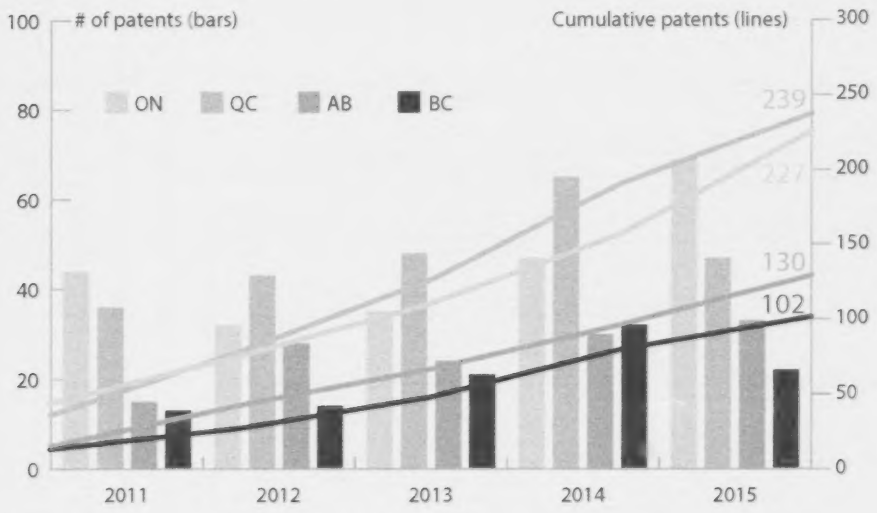
The number of patents issued in the province is even more impressive when one considers that B.C. is home to only one of Canada's U-15 universities, whereas Alberta has two and Quebec and Ontario each house several. Moreover, when one compares individual institutions, UBC (102) outranked all other institutions in cumulative patents awarded between 2011 and 2015. The next highest cumulative total was 101 for University of Toronto, followed by 93 each for the University of Montréal and McGill.

In 2015 alone, UBC was awarded 22 patents, second only to the University of Toronto (39).

Simon Fraser University and the University of Victoria added to the overall patents issued in B.C.'s higher education sector in 2015, receiving eight and five patents, respectively.

Beyond Canadian borders, British Columbia also holds up favourably. The 22 U.S. patents issued to B.C.'s top research university in 2015 most closely matched the number granted to five American institutes: Boston University/Boston Medical Center (21), Georgetown University (21), Oregon Health and Science University (21), University of Toledo (21) and University of Louisville (23). Of the 196 U.S. universities included in the survey, 81 were ranked higher than UBC, with 14 universities acquiring in excess of 100 patents in 2015. The University of California System[10] was awarded the most patents (478), followed by the Massachusetts Institute of Technology (314).

INDICATOR E-11: U.S. PATENTS ISSUED TO SELECTED INSTITUTIONS, ACTUAL AND CUMULATIVE[11]



UBC ranks among the top few universities in the country in terms of patents issued.

Data source: Association of University Technology Managers

Academic discovery fuels the formation of new and innovative business. Start-up companies[12] are a major part of the innovation process as firms that are already established are often unwilling

[10] Note that the University of California System is comprised of multiple campuses/institutions and, as such, should not be compared to individual institutions.

[11] Data includes all U-15 universities from each respective province.

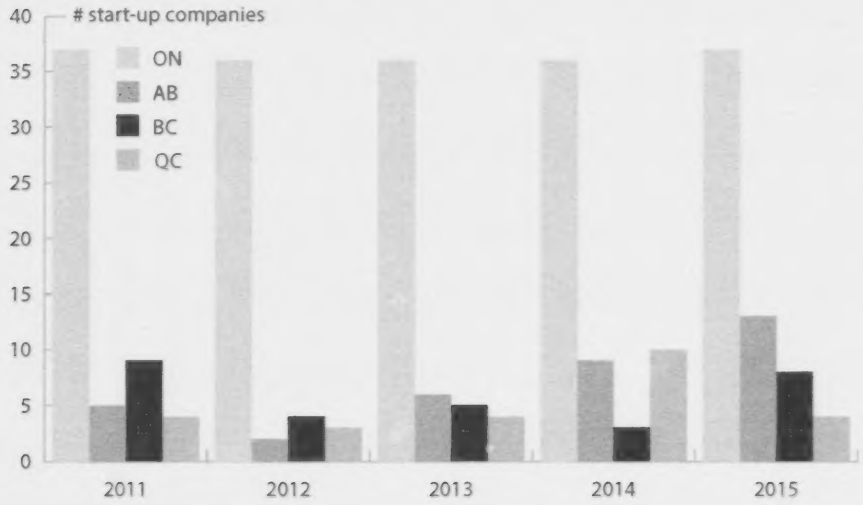
[12] The Association of University Technology Managers' (AUTM) definition for start-up activity relates specifically to a company formed solely around the licensing of technology into a newly formed company. Some new ventures that stem from Canada's institutions are not captured by this definition but are perhaps equally as fundamental to the financial and economic development of the institution as well as the economic region.

or unable to adopt new, high-risk technologies. It is often feared that new technologies will render existing investments and technologies obsolete. Start-up company activity is a significant component of the technology licensing process. In 2015, 66 new companies were formed nationwide based on academic discovery.

In that same year, with eight new start-up companies, the University of British Columbia was ranked a joint third (tied with the University of Calgary) among Canada's top research institutions. The University of Toronto ranked first, with 17 start-ups, followed by the University of Waterloo, which formed 15 start-up companies. At the provincial level, B.C. ranked third in 2015, behind Ontario (37) and Alberta (13).

In 2015, several American universities matched UBC in the number of start-ups formed, including Florida State University and Penn State University. In that same year, 152 U.S. institutions initiated fewer start-up companies than UBC.

INDICATOR E-12: UNIVERSITY START-UP COMPANIES FORMED BY SELECTED INSTITUTIONS, TOP FOUR PROVINCES[13]



B.C.'s single U-15 university formed eight start-up companies in 2015, third among Canada's U-15 universities.

Data source: Association of University Technology Managers

[13] Data includes all U-15 universities from each respective province.

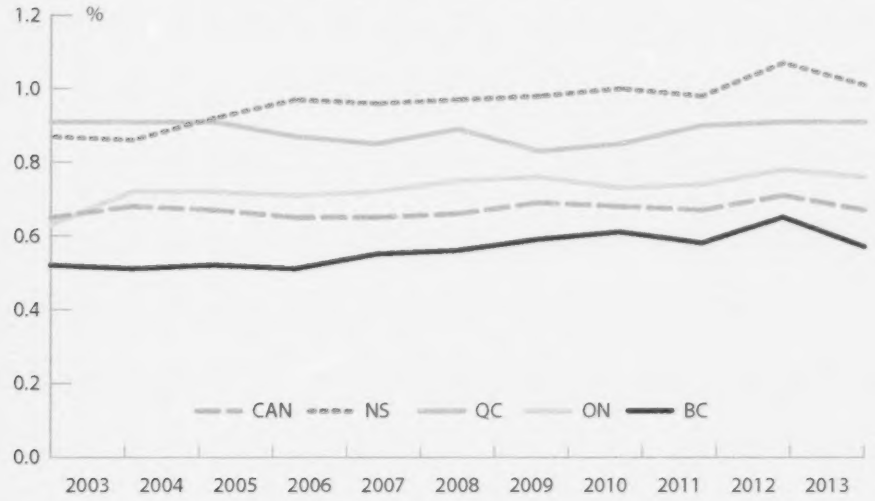
3.6. Performance of R&D by the Higher Education Sector

Research and development at universities contribute to high technology's impact on the economy in two ways. Published academic research is available to the public so that it can be used as a resource. Universities are also increasing partnerships with industry to bring the products and processes of R&D to market (see 'Technology Licensing'). The ratio of R&D performed by the higher education sector (HERD) to gross domestic product (GDP) is an indicator of the proportional investment in R&D by this sector relative to the size of the overall economy. A higher proportion of investment is likely to lead to higher rates of discovery.

In 2013, the Canadian higher education sector performed more than $12.7 billion worth of R&D, down slightly from $13.0 billion in 2012. The total in 2013 amounted to 0.7% of Canada's GDP in that year, unchanged over the past decade (0.7% in 2003).

Among the provinces, the ratio of HERD to provincial GDP was highest in Nova Scotia (1.0%) and lowest in Saskatchewan (0.4%). B.C.'s ratio sat at just under 0.6% ($1.3 billion), ranking seventh.

INDICATOR E-13: RATIO OF HIGHER EDUCATION PERFORMANCE OF R&D TO GDP



Among the provinces, B.C. ranks seventh in ratio of higher education R&D to GDP.

Data source: Statistics Canada

3.7. Research Funding

Funding for research in high technology industries not only supports current research within the economy, but also plays an integral role in attracting new researchers and encouraging a more innovative landscape. Funding is crucial in order to enhance Canada's reputation as a destination of choice for researchers and to make universities even more competitive in attracting prominent and competent researchers from around the world. Measurements of overall research funding for sectors pertaining to the scientific community and the distribution of the nation's Research Chairs are good indicators of the attractiveness of B.C.'s research environment.[14]

[14] In 2000, the Government of Canada created a new permanent program to establish 2,000 research professorships—Canada Research Chairs (CRC)—in universities across the country. The CRC Program invests each year to assist universities in recruiting and retaining the most brilliant and promising scientists and researchers, helping these institutions become global leaders in the fields of advanced science and technology. Chair holders aim to achieve research excellence in engineering and the natural sciences, health sciences, humanities and social sciences. The CRC Program imposes no restrictions on nominees with regard to nationality or country of residence, and as such, many foreign researchers are taking up chairs in Canada, including in British Columbia. The CRC Program offers eligible Canadian degree-granting institutions the opportunity to nominate outstanding researchers for senior professorships in areas that will further the institution's overall research priorities and enable them to maximize their contributions.

The CRC's Steering Committee includes several organizations that operate separately from the CRC, but which fund research undertaken by chair holders. These organizations are integral to the CRC Program. The Canadian Institutes of Health Research (CIHR), the Canadian Foundation for Innovation (CFI), and the Natural Sciences and Engineering Research Council of Canada (NSERC) are among those groups that oversee and contribute to the CRC Program.

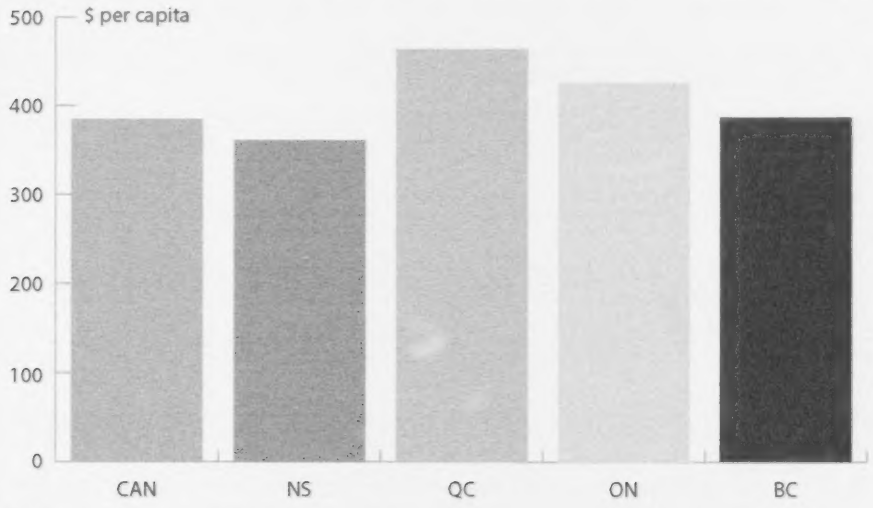
CIHR is the major federal agency responsible for funding health research in Canada; NSERC is the national instrument for making strategic investments in Canada's capability in science and technology; and CFI is an independent corporation established by the Government of Canada to strengthen national research capability through investments in research infrastructure in Canadian universities, colleges, hospitals and eligible not-for-profit organizations.

Measures of funding for research and skill development in the public and private sectors are direct indicators of the strength and sustainability of a province's research and development status. British Columbia's institutions have consistently received substantial funding from government and arm's length organizations for research conducted at its academic institutions. The province receives above average funding in some research areas, while others leave room for improvement.

Since 2000, up to and including the 2017/18 funding year, B.C.'s researchers have received nearly 6,400 grants and awards from the Canadian Institute of Health Research (CIHR). Combined, these awards amounted to a cumulative $1.8 billion in funding and 13% of overall national funding. Grants and awards received in British Columbia averaged $289,113 per award, slightly more than the national average of $287,523. Among the other provinces, the highest average award amounts were granted to institutions in Ontario ($309,487), followed by Quebec ($297,087).

On a per capita basis, Quebec ($464) receives the most funding, followed by Ontario ($426). With $386 per capita in funding, B.C. receives substantially more than neighbouring Alberta ($307).

INDICATOR E-14: PER CAPITA FUNDING OF CIHR GRANTS AND AWARDS, CUMULATIVE UP TO 2017/18[15]



B.C. ranks third in per capita funding from CIHR grants and awards.

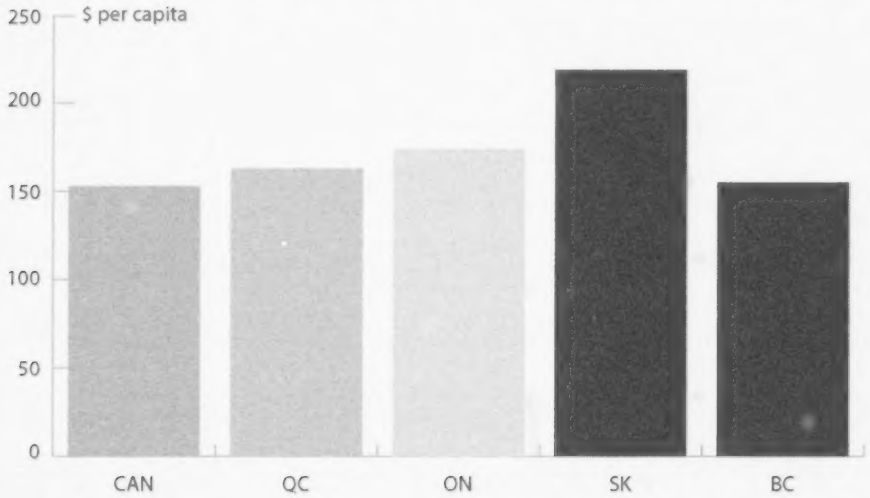
Data source: Canadian Institute of Health Research

As of 2015/16, the Canadian Foundation for Innovation (CFI) had funded a cumulative 9,414 research projects (since its inception in 1996/1997) among Canada's institutions, totalling $5.5 billion. B.C. was the recipient of funding for 1,180 of these projects, receiving nearly $724 million (13% of the national funding). The average funding per project was $613,401 in B.C., significantly higher than the national average ($583,688).

Per capita, B.C. ($154) ranked a solid fourth among the provinces.

[15] Cumulative funding since program inception (2000) up to and including fiscal year 2016/17. Per capita totals are calculated using projected population data for 2016.

INDICATOR E-15: PER CAPITA CFI FUNDING FOR RESEARCH, CUMULATIVE TO 2015/16[16]



Saskatchewan receives the most CFI funding per capita.

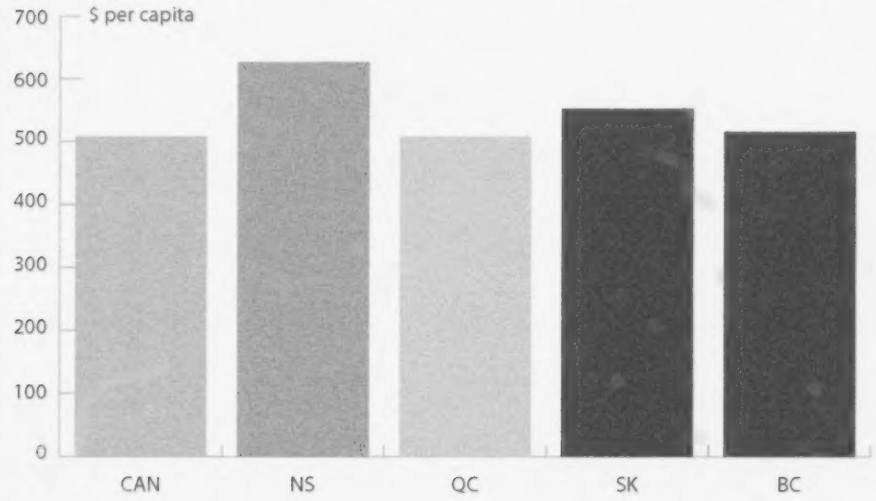
Data source: Canadian Foundation for Innovation

Since its inception in 1991/92, up to and including the 2015/16 funding year, the National Sciences and Engineering Research Council of Canada (NSERC) recorded more than $18.2 billion in expenditures on grants and scholarships nationwide. B.C. received funding for 61,163 projects over this period, amounting to a cumulative $2.4 billion in funding and 13% of the national funding. Grants and awards received in British Columbia averaged $39,461 per award, notably higher than the national average of $36,003.

On a per capita basis, B.C. received $515, behind only Nova Scotia ($627) and Saskatchewan ($552).

[16] Cumulative funding since program onset (1997) up to and including fiscal year 2015/16. Per capita totals are calculated using population data as at July 1st, 2015.

INDICATOR E-16: PER CAPITA NSERC-FUNDED GRANTS AND SCHOLARSHIPS, CUMULATIVE TO 2015/16



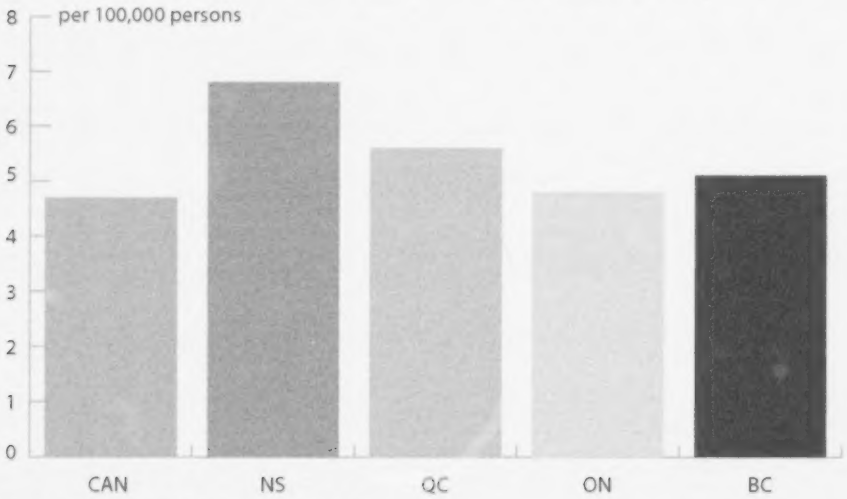
B.C. ranks third among the provinces in NSERC-funded grants and scholarships.

Data source: The Natural Sciences and Engineering Research Council of Canada

Since the Canada Research Chairs (CRC) Program and its committees maintain high standards of excellence for appointees, the ability to fill the chairs is a solid indicator of the attractiveness of the province's research community. In 2015, of the 1,690 CRCs currently in place at Canadian universities, 241 were at B.C. institutions. This accounts for 14% of Canada's chairs, more than Atlantic Canada, Saskatchewan and Manitoba combined. Across the country, just 12% of chair holders (205) have been recruited from outside of Canada. Conversely, of B.C.'s Chairs, nearly a third (32%) is from outside of Canada. The province is also above the national average in the number of female chair holders, with 35% fitting this description, compared to 28% nation-wide.

With five chairs per 100,000 persons in 2015, B.C. ranked third among the provinces in number of research chairs per capita.

INDICATOR E-17: CANADIAN RESEARCH CHAIRS PER 100,000 PERSONS, 2015



Data source: Canada Research Chairs Program

B.C. ranks third among the provinces in number of active research chairs per capita.

4. Business Indicators

This set of indicators concerns the stimulus to business formation and growth that comes from internal research and development (R&D), patenting and venture capital. It also measures results that are in part due to these stimuli, in the form of business entries and exits, high growth companies and the overall growth in the number of establishments.

British Columbia returns above average ratings compared to other provinces in some of the business stimulus indicators, while others show less promise.

TABLE 3: QUICK SUMMARY OF INDICATORS FOR THE BUSINESS SECTOR

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
B-1: Patents per 100,000 persons	↑	↑	6 of 10
B-2: Patents granted as a % of applications, 3 year average	↑	↑	8 of 10
B-3: Entries to the high tech sector	↑	↓	n/a
B-4: Exits from the high tech sector	↑	↓	n/a
B-5: High growth high tech companies	↑	↑	n/a
B-6: Venture capital investment, per capita	n/a	n/a	1 of 10
B-7: Venture capital investment: share of Canadian total	n/a	n/a	3 of 10
B-8: Business expenditure on R&D (BERD) to GDP	↓	→	3 of 10

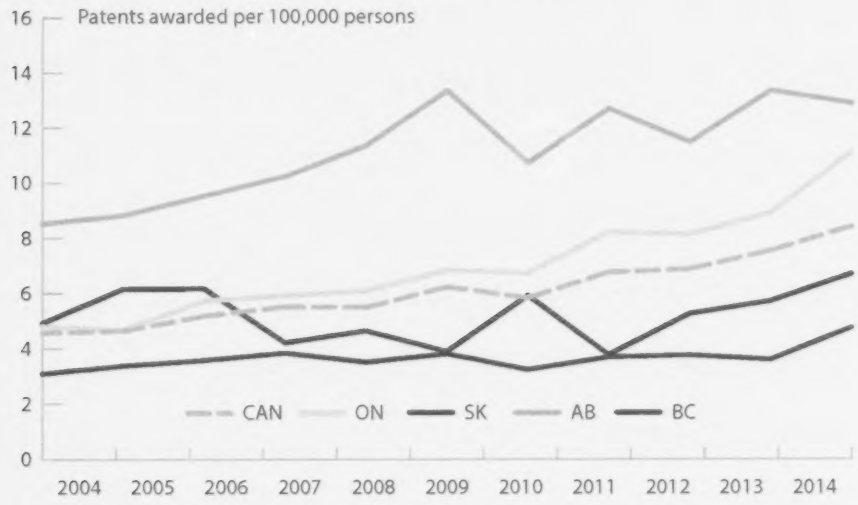
4.1. Patents and Applications

Patents are an indicator of the intellectual capital of innovation. According to the Canadian Intellectual Property Office, their mandate is to "grant patents which will result in the protection of the inventor and dissemination of technical information, and the encouragement of the creation, adoption, and exploitation of inventions." Patent applications may be rejected for a number of reasons, "including lack of novelty, obviousness, and lack of patentable subject matter." Patents are key tools for researchers, academics and businesses that need to stay shoulder-to-shoulder with developments in their fields.

The volume of patent applications and the number of patents granted are indicators of the success of research and development, whether in the public or private sector. British Columbia has consistently lagged most of the other provinces in terms of patents awarded per capita.

In 2014, B.C. applicants were awarded 220 patents, or 4.7 per 100,000 persons. Since 2000, Alberta has maintained a first-place rank in patents granted per capita and 2014 was no exception. In that year, Alberta boasted 12.9 patent awards per 100,000 persons, well ahead any other province and the national average (8.4).

INDICATOR B-1: PATENTS AWARDED PER 100,000 POPULATION



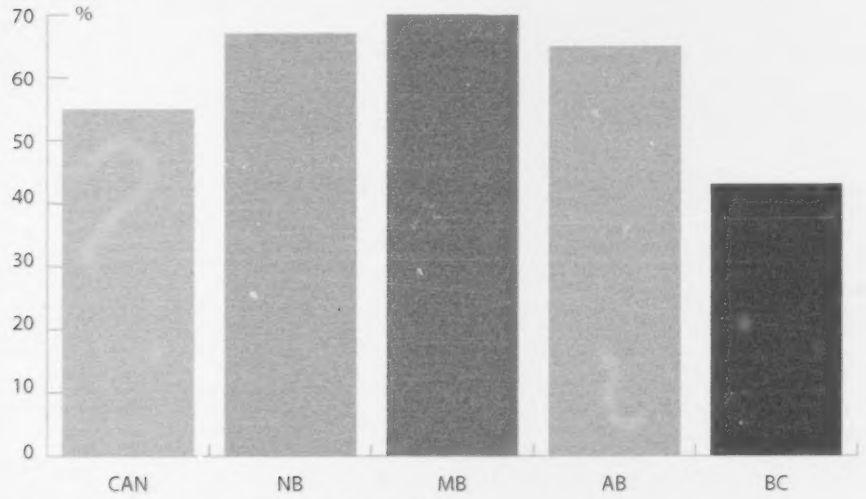
B.C. ranks sixth among the provinces in patents awarded per capita.

Data source: Canadian Intellectual Property Office

Patent applications are rejected almost as frequently as they are accepted. Between 2012 and 2014, just over half (55%) of patent applications were accepted in Canada. The low acceptance rates across the country suggest that applicants generally begin the process of applying for a patent with little knowledge of the procedure (s) or of their chances of success. This pattern seems somewhat more common in British Columbia. In B.C., only 43% of applications resulted in a patent being issued in the 2012 to 2014 period.[17]

[17] Patent applications take an average of 25 months to be processed. Thus, to know how many applications filed in 2012 were accepted, one must look at patents granted in 2014. Figures presented here show patent grants in 2014 as a percent of applications in 2012.

INDICATOR B-2: PATENTS GRANTED AS A PERCENT OF PATENT APPLICATIONS (THREE-YEAR AVERAGE, 2012-2014)



Alberta has the highest rate of acceptance for patent applications.

Data source: Canadian Intellectual Property Office

4.2. Sector Dynamism: Entries and Exits[18]

A dynamic sector, characterized by a healthy mixture of large and small, old and new firms, is ideal for generating high levels of innovation. Large, established firms provide employment and earnings stability while small start-ups often provide market responsiveness, creativity and employment growth. The high technology labour force is combined with capital and ideas in the drive to generate new goods and services. A stagnant sector, characterized by several large firms and low levels of entry and exit, is not likely to generate high levels of innovation.

High tech sector entry rates indicate the percentage of firms currently in the sector that are new (i.e., did not exist in the previous year). Similarly, exit rates show how many firms left the high tech sector (or went out of business) as a percentage of the total number of high tech firms.[19]

Innovation is integral to the high tech sector. Along with an innovative spirit comes a somewhat volatile environment for businesses. One consequence of this is a high rate of business failures. On the other hand, small start-up firms in high tech are often at the leading edge of innovation, and are crucial to the ongoing strength of the sector.

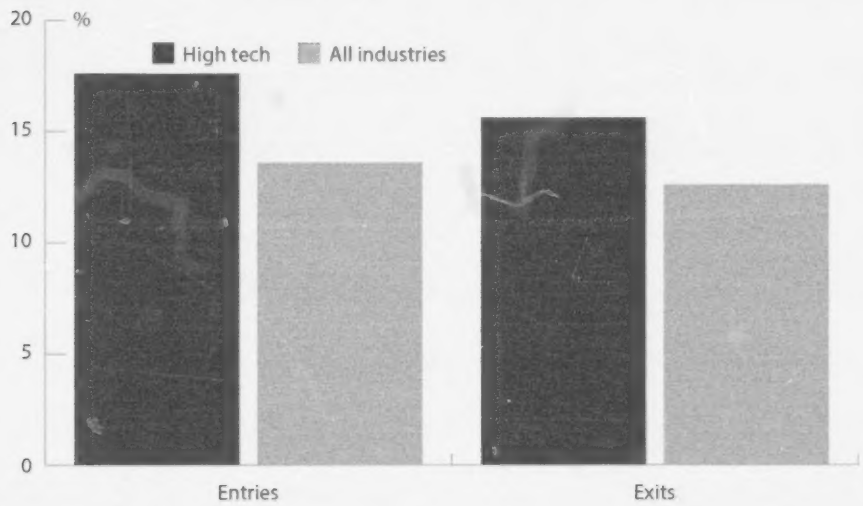
[18] Note that a comparison with other provinces for indicators B-3, B-4 and B-5 is not possible because of lack of accessibility to the necessary data.

[19] With the release of the 2008 data, Statistics Canada introduced the concept of a statistical "location" replacing statistical "establishment." The location, as a statistical unit, is defined as a producing unit at a single geographic location at which, or from which, economic activity is conducted and for which, at minimum, employment data are available. One consequence of this change is that location data prior to 2007 are not available. Note that only companies with employees are included in these data.

A good way to measure the strength of a specific sector is to compare it to the overall economy. Between 2010 and 2015 tech firms had an average annual entry rate of +17.2%, while the number of firms in the B.C. economy as a whole had a much lower average annual entry rate (+12.3%). Similarly, the exit rate in the province's high tech sector (+15.4%) was also higher than the average business exit rate (+11.9%). As a result of the stronger growth in entries, high technology firms expanded by over 1,000 businesses over the five-year period, to 9,905 in 2015. High exit rates are not necessarily a sign of long-term trouble in the high tech sector, as this type of competitive environment is often a marker of high levels of innovation. The innovative atmosphere of high tech businesses in the province can potentially lead to volatility.

Entries into the high technology sector have exceeded exits in three of the last five reporting years, such that the overall number of high technology establishments has been growing fairly steadily. In 2015, entry rates (17.6%) were notably higher than exit rates (15.6%), while the entry rates (13.6%) for B.C. businesses as a whole also exceeded exit rates (12.6%).

INDICATORS B-3 AND B-4: ENTRY AND EXIT RATES IN THE HIGH TECH SECTOR COMPARED TO ALL INDUSTRIES, 2015



Entry and exit rates are higher than average in the high tech sector.

Data source: BC Stats

4.3. High Growth Companies

High levels of growth are strong indicators of the success of a sector. An increasing number of high growth companies will create new jobs, new wealth and new government revenues.

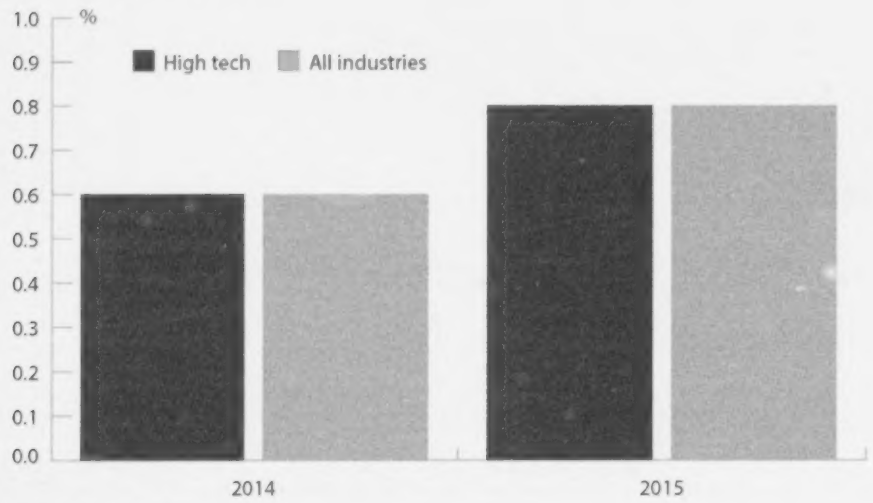
BC Stats defines "high growth companies" as those which increase by at least two employment size categories in one year. For example, a firm that has one to four employees would be considered high growth if it expanded to have 10 to 19 employees over the course of one year. Similarly, a company with 100-149 workers expanding to 200-249 workers would also be considered high growth. There are 21 employment size categories, which provide a considerable amount of detail.[20]

Companies exhibiting elevated levels of growth are indicative of the potential of the high tech sector. Very few companies qualify as high growth, but they can be slightly more common in the high tech sector than elsewhere. The high technology sector is often thought to be a breeding ground for rapid growth firms—small start-up companies that grow exponentially over short periods of time.

[20] It should be cautioned that, because the exact number of workers in a firm is not known, this measure will be somewhat imprecise. Further, because the last employment category is "5,000 and over," it is impossible for a large corporation to be classified as high growth. These data, then, principally apply to small and medium-sized establishments.

In 2015, 0.75% of all companies in B.C. showed rapid growth in number of employees, up marginally from the previous year (0.62% in 2014). The share of high growth high technology businesses was a touch higher than that for the economy as a whole (0.79% in 2015), and also up slightly from 2014 (0.64%). In actual numbers, there were 1,450 high growth businesses in the overall provincial economy in 2015, 78 of which were in the high tech sector.

INDICATOR B-5: HIGH GROWTH COMPANIES FOR THE HIGH TECH SECTOR AND FOR ALL INDUSTRIES, 2014 AND 2015



In 2015, the high tech sector and the economy as a whole have comparable shares of companies that are classified as high growth.

Data source: BC Stats

4.4. Venture Capital Investment

Venture capitalists specialize in investing in high-risk company start-ups or expansions, providing the seed funds for projects that are often involved in the development of new products or processes. They take a portfolio approach, so while many high-risk investments may never be commercially viable, those that do succeed are expected to provide high returns to compensate for the total risk capital invested across the portfolio. Venture capital (VC) investment by province gives an indication of both the quality of ventures in a given province and the investors' assessment of the business climate. It also reflects the risk tolerance of investors in different regions and over time.[21]

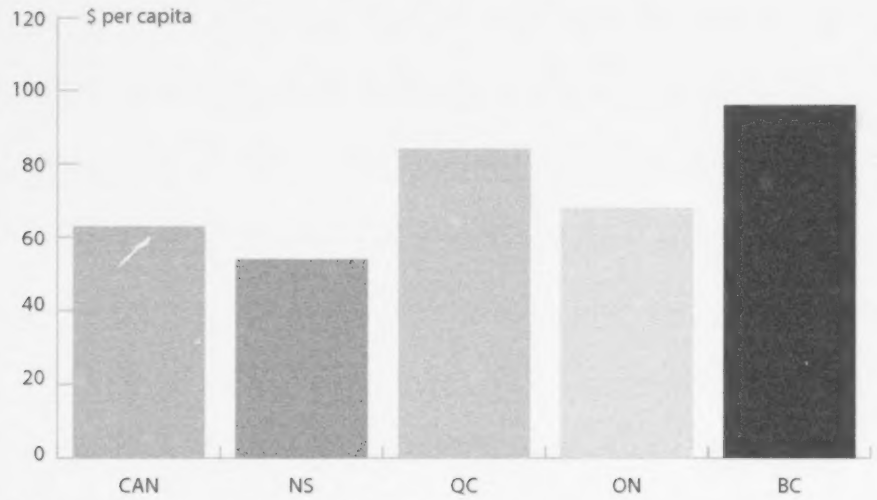
In 2015, Canada's venture capital investment reached nearly $2.3 billion, with B.C. attracting $450 million of the nation's investment income. Quebec ($693 million) and Ontario ($939 million) were the only provinces to exceed B.C. in 2015.

Given the province's strong performance, its investment per capita topped any other province in 2015. B.C. boasted an average venture capital investment of $96 per 100,000 population, nearly four times that of Alberta ($25) and considerably higher than Ontario ($68). Quebec recorded the second highest per capita investment ratio in the country ($84) and was the only other province to exceed the national average ($63). Nova Scotia ($54) also achieved a notable per-capita venture capital investment ratio in 2015.[22]

[21] It should be noted that the data-set used for this report includes investment from all sources and, as such, does not distinguish between foreign and domestic investment.

[22] Most of the other potential financing indicators, such as debt financing, are either available only for Canada with no provincial breakdown, or do not provide sufficient years of reporting to establish trends and are therefore not included in this report.

INDICATOR B-6: CANADIAN VENTURE CAPITAL INVESTMENT PER CAPITA, BY PROVINCE OF INVESTMENT, 2015 ($)

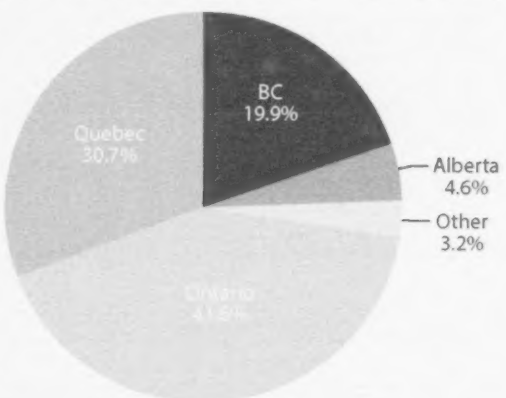


B.C. outranks all other provinces in venture capital investment per capita.

Data source: Canadian Venture Capital Association

B.C. held a 20% share of the country's venture capital investment in 2015, a far greater portion than in any other province outside Canada's industrial core. The share of investment in B.C. exceeded that of Alberta, Saskatchewan, Manitoba, and Atlantic Canada combined. Ontario (42%) retained the largest share of the country's venture capital investment, followed by Quebec (31%).

INDICATOR B-7: SHARE OF CANADIAN VENTURE CAPITAL INVESTMENT, 2015



B.C. boasts a larger share of Canadian venture capital investment than the Prairie Provinces and Atlantic Canada combined.

Data source: Canadian Venture Capital Association

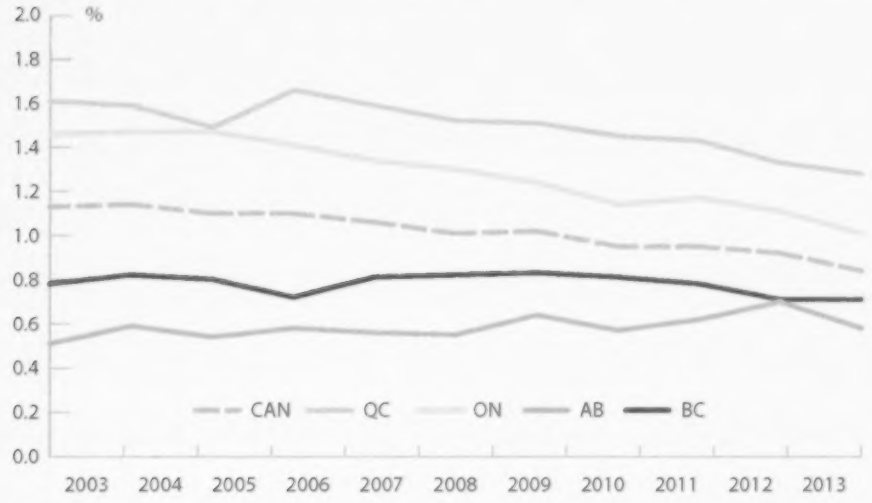
4.5. Performance of R&D by the Business Sector

Research and development (R&D) provides the potential for innovation and new discoveries in the form of new products, services or processes that eventually enhance productivity. In this way, R&D is viewed as an investment in future production of the economy. The ratio of R&D performed by business (BERD) to GDP is an indicator of the proportional investment in R&D by the business sector relative to the size of the overall economy. It is assumed that a higher proportion is likely to lead to higher rates of discovery and increased commercialization activity.

Canada's business sector performed $16.0 billion worth of R&D in 2013, amounting to about 0.8% of the nation's GDP in that year. The ratio of business R&D (BERD) to provincial GDP has historically been much higher in Quebec and Ontario than in the rest of the country. Although B.C. (0.7%) was well above most provinces in R&D to provincial GDP in 2013, it was far exceeded by Ontario (1.0%) and Quebec (1.3%).

In 2013, Ontario and Quebec made up a combined 73% of business R&D in Canada. At the same time, B.C.'s share was 10%, while12% was attributable to Alberta.

INDICATOR B-8: RATIO OF BUSINESS PERFORMANCE OF R&D TO GDP



Data source: Statistics Canada

Quebec's ratio of business performance of R&D to GDP remains well above that of the other provinces.

5. Government Indicators

The government sector impacts the high technology environment by funding and directly performing R&D, and by providing a regulatory, tax and infrastructure environment for the private sector to operate within.

In general, the tax regime varies substantially across provinces. For example, B.C. has a considerably lower corporate income tax rate than other provinces, while Manitoba has no small business tax.

This section also includes a summary of gross expenditures on R&D (GERD) in British Columbia. This consists of R&D performed by business and higher education in addition to federal and provincial governments. Generally, direct performance of R&D by government has lagged in B.C. compared to other provinces.

TABLE 4: QUICK SUMMARY OF INDICATORS FOR THE GOVERNMENT SECTOR

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
G-1: Personal tax index individual with $80,000 income	↓	↓	1 of 10
G-2: Small business tax rate	→	→	3 of 10
G-3: Corporate income tax rate	→	→	2 of 10
G-4: Government expenditure on R&D (GOVERD) to GDP	→	↑	10 of 10
G-5: Gross expenditure on R&D (GERD) to GDP	→	↓	4 of 10

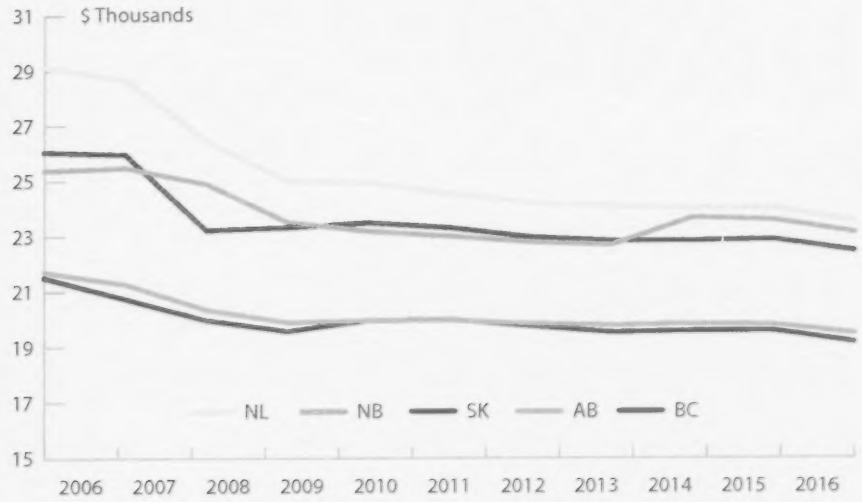
5.1. Tax Rates: Individual and Corporate

High technology companies are highly mobile because much of the input to their production is derived from human capital. As a result, high technology companies are often free to seek an ideal location to establish operations. Lower levels of taxation are thought to attract investment and encourage a skilled labour pool. On the other hand, desirable amenities that may play an equal role in attracting skilled workers, such as quality of life, social programs, environmental standards and regulated working conditions may result in higher levels of taxation.

One significant policy area over which the government has complete control is tax rates. Lower levels of taxation are thought to attract investment and a skilled workforce—both essential to the high technology sector. Also, a better quality of life associated with regulation of working conditions, environmental standards and universal social programs are thought to be appealing to high technology workers. Such amenities tend to result in higher levels of taxation.

In recent history, British Columbia taxation levels for single (unattached) individuals earning $80,000 or more a year have declined steadily and the province has had the lowest rate in Canada for most of the last decade. The total taxes levied to high income earners in the province averaged $19,153 (or 24%) in 2016, the lowest level in the nation. This rate was down 2.1% from 2015 and reflects a considerable decline since 2006, when taxes amounted to $21,497 (27%). The long-term decrease in personal taxes on high-income earners has not been unique to British Columbia; taxation rates have also exhibited a downward trend in most other provinces. As average taxes paid by high-income earners in B.C. continue to fall, the province's rates are well below most other parts of the country. However, taxes paid in neighbouring Alberta (which declined 1.6% to $19,487 between 2015 and 2016) remain close to those paid in British Columbia.

INDICATOR G-1: AVERAGE OF ALL TAXES PAID BY UNATTACHED INDIVIDUALS EARNING $80,000 PER YEAR ($ '000), LOWEST PROVINCES

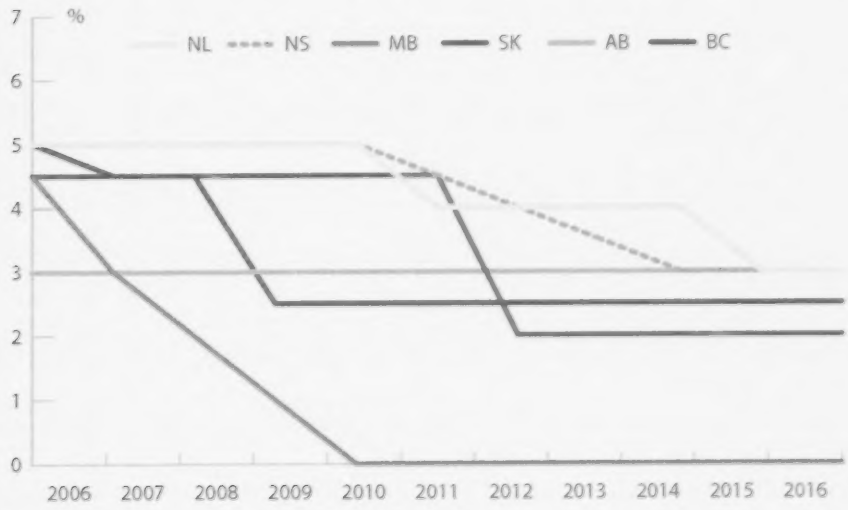


Data source: B.C. Ministry of Finance

Over the past decade, B.C. and Alberta have had nearly identical taxation levels for high-income earners.

British Columbia's small business tax rate paints a similar picture to that of high income individuals. In 2000 and 2001, B.C. boasted the lowest small business tax rate in the country. In the years that followed, some of the Atlantic Provinces dropped rates substantially, as did Alberta and Manitoba. In 2016, the rate in B.C. (2.5%) was among the lowest in the country, resting just below that of Alberta (3.0%) and just above that of Saskatchewan (2.0%). Meanwhile, Quebec's tax rate has hovered around eight or nine percent (8.0% in 2016) for the past decade, while Manitoba has succeeded in eliminating the small business tax altogether.

INDICATOR G-2: SMALL BUSINESS TAX RATE

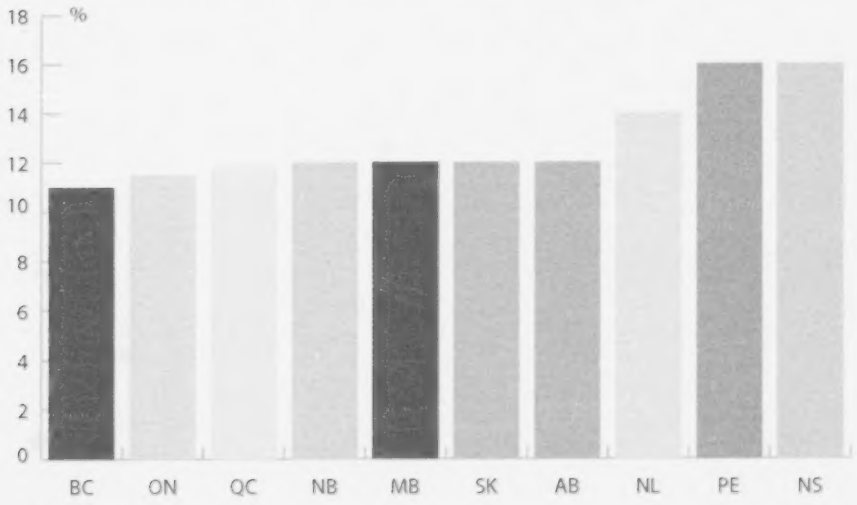


Data source: B.C. Ministry of Finance

B.C.'s small business tax rate is among the lowest in the country.

In 2016, British Columbia's general corporate income tax rate (11.0%) was lower than every other province. Prior to 2008, Quebec had the lowest rate, but, in 2008, it raised its rate from 9.9% to 11.4% and bumped it up again in 2010. In 2016, P.E.I and Nova Scotia (each 16.0%) had the highest corporate tax rates in the nation.

INDICATOR G-3: GENERAL CORPORATE INCOME TAX RATE IN 2016



B.C. has the lowest corporate tax rate in Canada.

Data source: B.C. Ministry of Finance

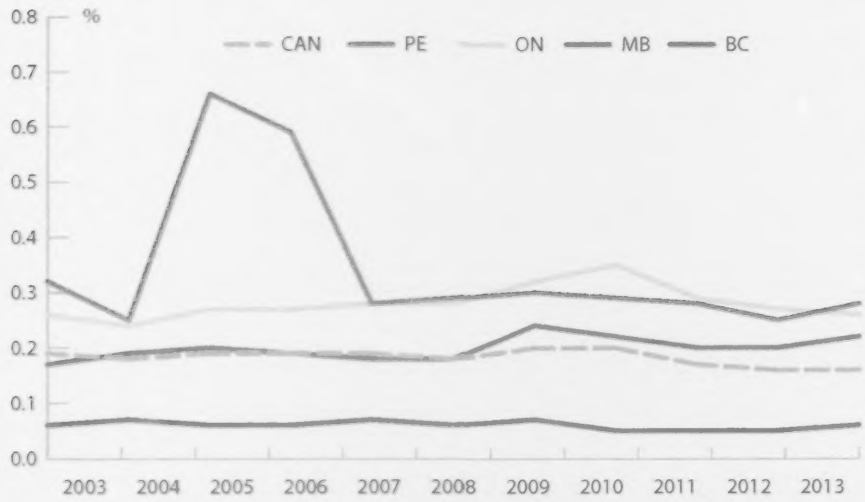
5.2. Performance of R&D by the Government Sector

Government tends to fund much more R&D than it undertakes directly. However, in some fields, governments do maintain research personnel in order to provide independent testing of products, processes and practices. The purpose of most internal government research is review, and not necessarily focused on innovation. Significant innovations developed by government researchers are often spun-off to the private sector. The ratio of government R&D to GDP is an indicator of the proportional investment in R&D by the government sector relative to the size of the overall economy.

The combined federal and provincial government sector in Canada performed $3.1 billion worth of R&D in 2013, up substantially (+5.6%) from 2012. This accounted for approximately 0.16% of Canada's GDP in that year.

Across the country, Ontario has historically maintained by far the highest ratio of government R&D to GDP. With a ratio of 0.26% in 2013, Ontario lost its position to P.E.I. (0.28%). Meanwhile, B.C. has consistently ranked last among the provinces. This held true in 2013, as its ratio crept up 0.01 percentage points to 0.06%.

INDICATOR G-4: RATIO OF COMBINED FEDERAL AND PROVINCIAL PERFORMANCE OF R&D TO GDP



Data source: Statistics Canada

Ontario and P.E.I. have historically had the highest ratio of government R&D to GDP.

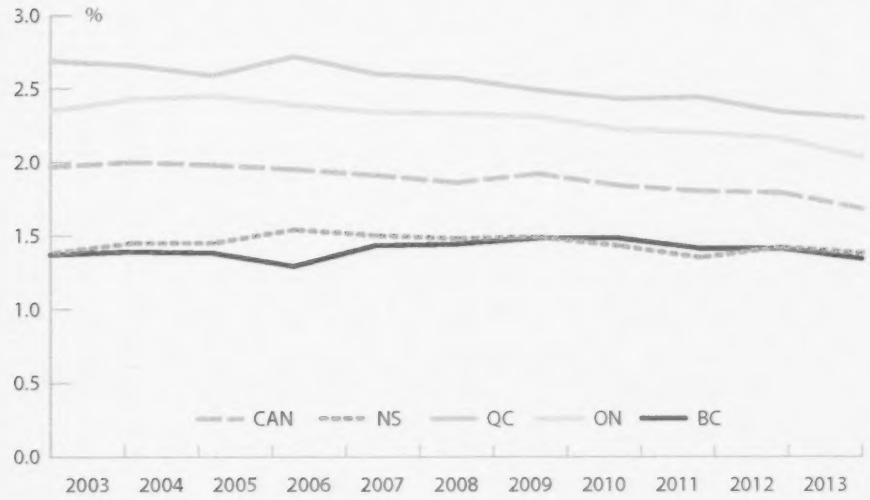
5.3. Gross Expenditure on R&D

The overall ratio of total R&D effort to the overall economy, also known as the GERD ratio, is a measure of how much a jurisdiction is willing to sacrifice current consumption for potentially increased future capacity. The changing structure of the ratio (the relative size of the component investments by the government, business and higher education sectors) over time is a measure of the shifting importance different sectors place on the performance of R&D.

Gross Canadian expenditure on research and development (GERD) was nearly $32.0 billion in 2013, a 2.2 % decrease over the previous year. This amounted to 1.7% of Canada's GDP in that year.

The GERD to GDP ratios for Quebec and Ontario have been the highest over the last decade and 2013 was no exception. Between 2012 and 2013, Ontario's rate slipped from 2.2% to 2.0%, while Quebec's remained unchanged, at 2.3%. In 2013, Saskatchewan's ratio was lowest among the provinces at 0.9%, while B.C.'s was considerably higher (1.3%).

INDICATOR G-5: RATIO OF TOTAL EXPENDITURE ON R&D TO GDP

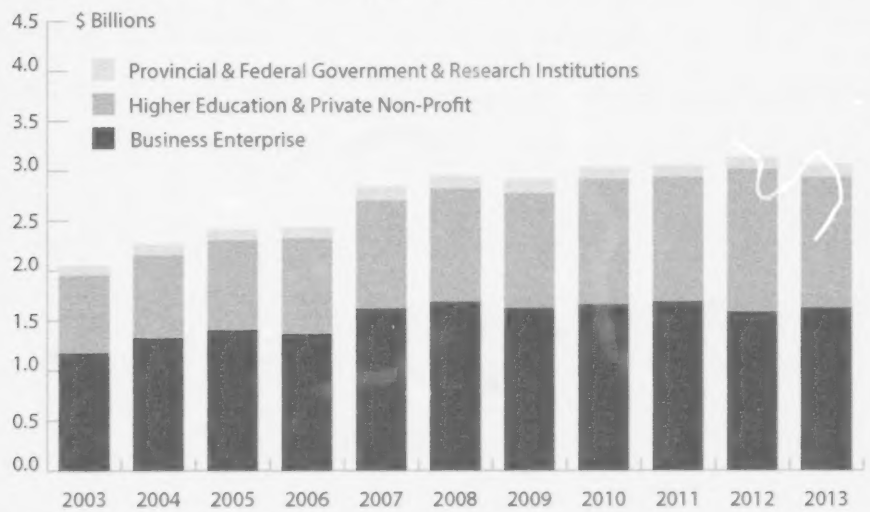


B.C. ranks fourth in the country in its ratio of total expenditure on R&D to GDP.

Data source: Statistics Canada

The largest single performer of R&D in B.C. is the business sector. Business performed more than half (53%) of R&D in the province in 2013, while higher education comprised a further 43%. Together, the federal and provincial government performed just five percent of B.C.'s R&D effort. This is also a common trend among other provinces. For example, in Alberta, the business sector accounted for 55% of performed R&D and higher education made up 37%. However, government performed a much higher share of research in that province (8%) than in British Columbia.

SHARE OF R&D PERFORMANCE IN B.C., BY SECTOR



The business sector is consistently the leading performer of R&D in B.C.

Data source: Statistics Canada

6. External Indicators

Along with the nation as a whole, British Columbia benefits from a large number of well-trained and educated immigrants. Also of interest, but more difficult to monitor, is the skill-set of immigrants and the type of occupations they enter. Migration to B.C. from other Canadian provinces is also an important source of educated and trained workers

British Columbia's economy is highly dependent on trade with other provinces and foreign countries, both as a source of goods and services used in the province and as markets for its products and services. Trade relationships play an integral role in the high tech sector, as they do in the economy as a whole. Since imported components are often used to produce high tech products, imports of high technology goods can be an indicator of future production. B.C.'s high tech imports have been volatile over the past decade and are impacted by currency exchange rates and the health of the overall economic climate.

TABLE 5: QUICK SUMMARY OF INDICATORS FOR THE EXTERNAL SECTOR

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
X-1: Percentage of immigrants with 16+ years of education		↓	4 of 10
X-2: Median years of schooling of immigrants		↓	6 of 10
X-3: Net inter-provincial migration	↑	↑	1 of 10
X-4: High technology imports	↑	↑	n/a

6.1. Educational Background of Immigrants

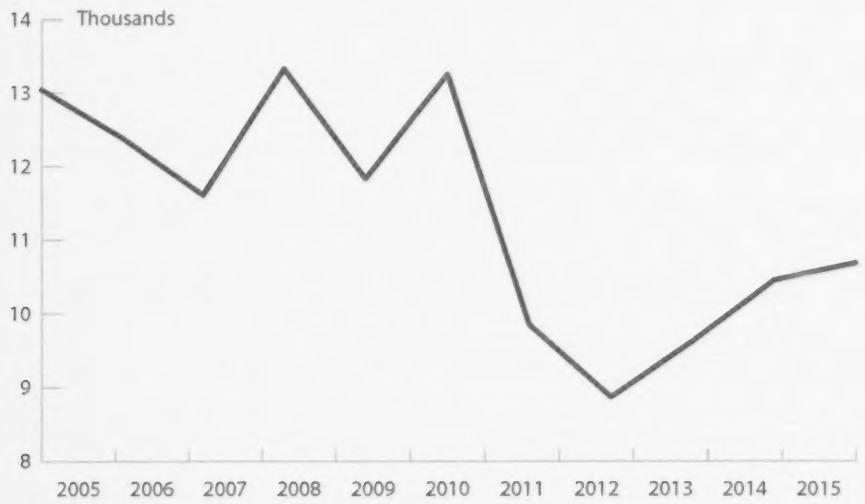
The economic effects of immigration depend on the skills and resources immigrants bring with them. Two specific indicators of the educational attainment of immigrants are the percentage of immigrants aged 25 years and older with 16 or more years of education (sufficient levels to obtain a university degree in Canada) and the median years of education of immigrants aged 25 years and older at landing. An influx of highly educated immigrants increases the supply of skilled labour and can provide a significant boost to high technology companies. Immigrants also offset the loss of skilled workers who move to other provinces or out of Canada.

Over the past several years, British Columbia has experienced high levels of immigration, and in 2015, this trend continued.[23] As in other parts of the country, immigrants to the province tend to be well educated.

B.C. has certainly been a central destination for skilled immigrants. Over the past decade (from 2005 to 2015), the province received nearly 125,000 immigrants with 16 or more years of education—more than any other province other than Quebec and Ontario. One reason for B.C.'s success in attracting these immigrants is that Asia has become the top origin for immigrants to Canada and British Columbia's relative proximity to Asia compared to the rest of Canada makes it a prime destination.

[23] For detailed immigration data, see the BC Stats website: http://www.bcstats.gov.bc.ca.

INDICATOR X-1: ADULT IMMIGRANTS TO B.C. WITH 16 OR MORE YEARS OF SCHOOLING AT TIME OF LANDING



The number of immigrants to B.C. with 16 or more years of schooling has begun to rebound.

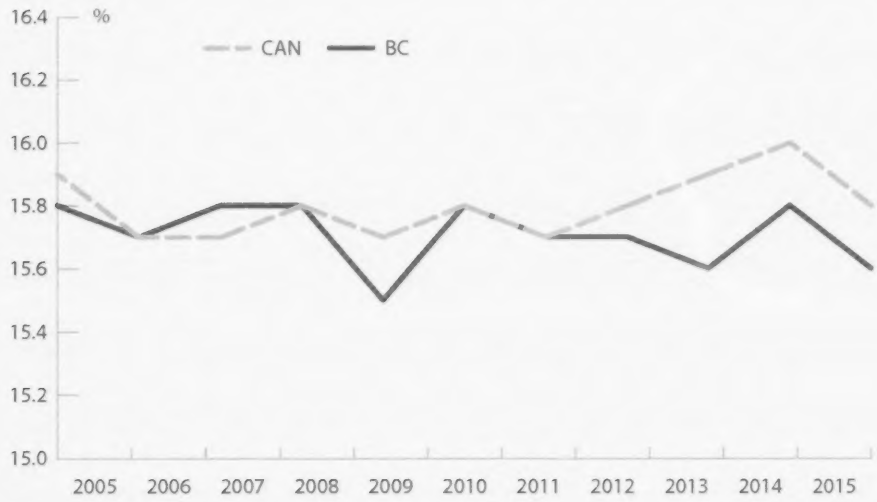
Data source: Citizenship and Immigration Canada

The number of immigrants with 16 or more years of education landing in B.C. has declined (-18.1%) over the last decade. In 2005, B.C. recorded 13,041 landings, compared to 10,676 landings in 2015. Ontario also reported a decline (-21.5%) of skilled immigrant landings over the same period, falling from 40,622 in 2005 to 31,869 in 2015. On the other hand, the migration of highly educated immigrants to smaller provinces such as P.E.I., New Brunswick, Saskatchewan and Manitoba has surged over the last decade. For example, the number of skilled immigrants landing in P.E.I. climbed from 97 in 2005 to 358 in 2015, an increase of 269.1%. Similarly, in Saskatchewan, landings went from 528 in 2005 to 3,111 in 2015, a jump of 489.2%. Nationally, the number of highly educated immigrants has climbed by 2,832 (+3.7%).

In 2015, the median education level of adult immigrants (aged 25 years and older at landing) to B.C. was 15.6 years of schooling, slightly under that of top-ranking Quebec (16.3 years), but relatively on par with that the national average (15.8 years).

The median years of schooling of immigrants aged 25 years and older appears to have reached a plateau in recent years. From 2005 to 2015, the Canadian median has hovered at approximately 16.0 years of schooling.

INDICATOR X-2: MEDIAN YEARS OF SCHOOLING AMONG IMMIGRANTS AGED 25 YEARS AND OLDER



Data source: Citizenship and Immigration Canada

Immigrants to B.C. and to Canada as a whole have a similar median number of years of schooling.

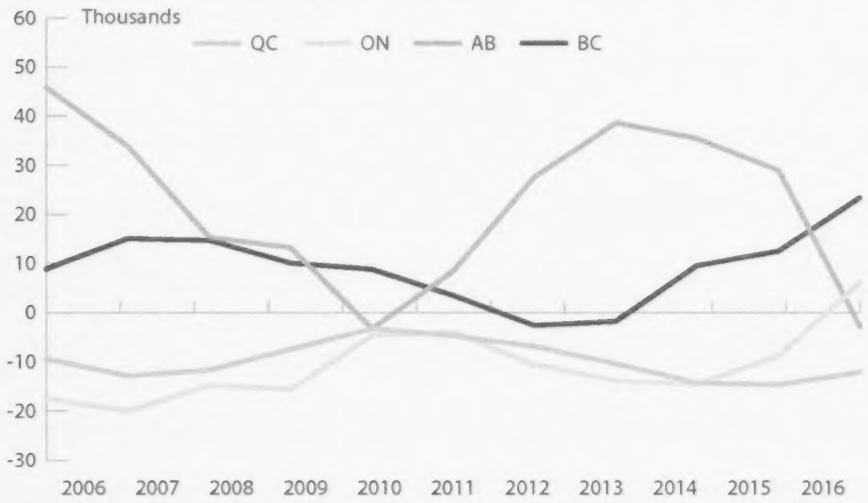
6.2. Inter-provincial Migration

Canadian workers are much freer to move within the borders of the country than they are internationally. In aggregate, population movement between provinces is a general indicator of perceived economic opportunity and general attractiveness. Individuals and families often relocate for economic reasons. In this way, this indicator points to the overall perception of the strength of provincial economies and the labour pool from which employers can draw.

The pattern of inter-provincial migration in Canada is substantially dictated by people seeking better economic opportunities. With the exception of 2011 and 2012, B.C. has seen a steady in-migration from other provinces over the past decade. In 2016, the province experienced a net inflow of nearly 23,300 migrants, marking the third consecutive year of net inter-provincial gains. In that same year, Alberta recorded a net loss of population to other provinces for the first time since 2010.

Over the last decade, B.C. and Alberta were the only provinces to experience an annual net in-migration. Alberta gained an average of more than 21,000 between 2006 and 2016, while, over the same period, B.C. welcomed an average of nearly 10,000 residents from other provinces per year.[24]

INDICATOR X-3: NET INTER-PROVINCIAL MIGRATION



B.C. saw the largest net inflow of people from other provinces in 2016.

Data source: Statistics Canada

[24] Dates for this indicator are in Census years, such that '2016' refers to the July 1st, 2015 to June 30th, 2016 period.

6.3. High Technology Imports

Although a heavy reliance on imports can create a negative trade balance (the difference between the value of goods exported and the value imported), imports of high technology goods are often essential to supply domestic supply chains that turn imports into future exports. For instance, without state-of-the-art telecommunications, the high technology sector as a whole would struggle. Similarly, purchases of computer integrated manufacturing technology would displace future imports of other goods, whether high technology or low technology, and could generate goods for export. More importantly, high technology imports are a key driver in productivity growth and enhancing competitiveness.[25]

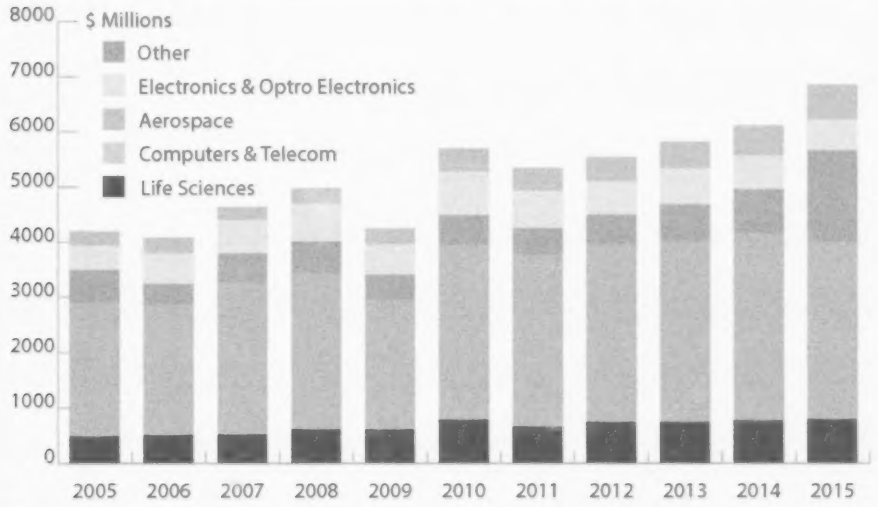
Imports of high technology goods are crucial to the success of B.C.'s high technology sector.[26] B.C. imports of high technology products were valued at $6.9 billion in 2015. Computers and telecommunications are the main component (50%) of high technology imports. Aerospace (19%) and Life Sciences (12%) also make up notable shares.

[25] Although some tech imports are consumer goods, such as smart phones, laptops, etc. for personal/household use, a significant portion is comprised of goods and services utilized by businesses operating in the high tech sector.

[26] Note that imports have not been adjusted for inflation or exchange rate effects.

Imports of electronics and opto-electronics have expanded substantially over the past ten years and in 2015 comprised a combined 10% of overall high tech imports.[27]

INDICATOR X-4: VALUE OF HIGH TECHNOLOGY IMPORTS TO B.C. ($ MILLION)

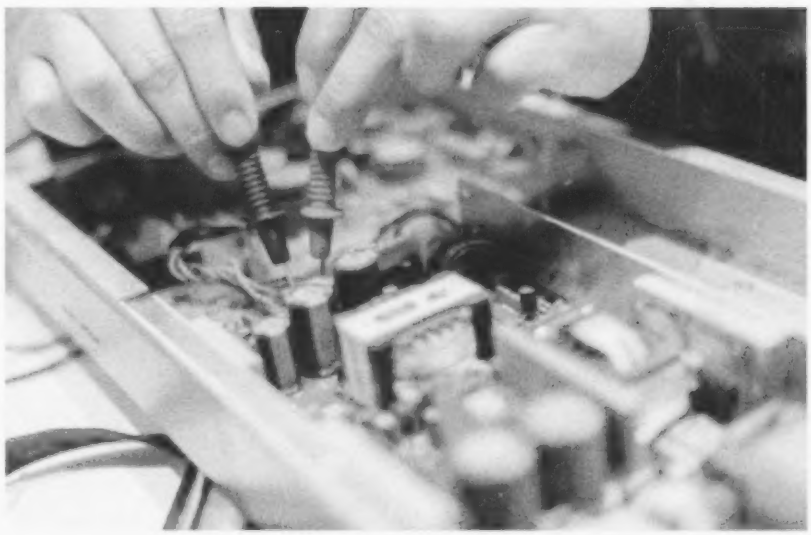


Data source: BC Stats

Computers and telecommunications make up most of high technology imports to B.C.

[27] For a description of what these commodity groups contain, see Appendix B of the BC Stats *Profile of the British Columbia High Technology Sector* report.

7. Labour Indicators



The following section is a set of indicators that are specific to the labour market but that represent a combined impact of the source sectors. In the case of labour input, indicators such as the unemployment rate are not attributable to a single source sector.

Nation-wide, rates of unemployment among workers in the natural and applied sciences are consistently well below those for the economy as a whole. Unemployment rates in this sector have been falling quite consistently since the early 1990s. The past decade has witnessed both the highs and lows of unemployment rates in B.C., from the labour shortage crisis of 2006-2008 to the economic slowdown that began in late 2008.

TABLE 6: QUICK SUMMARY OF INDICATORS FOR LABOUR

INDICATORS	Trend		Ranking
	Long-Term	Latest Year	Overall
L-1: Unemployment rate for natural and applied sciences	→	↓	2 of 10
L-2: Research personnel per 100,000 population	↑	↓	3 of 10
L-3: Quality of life, Vancouver∞	↓	→	5 of 221
L-4: Cost of living*	→	↑	10 of 11

∞ The ranking compares Vancouver to 221 cities worldwide.

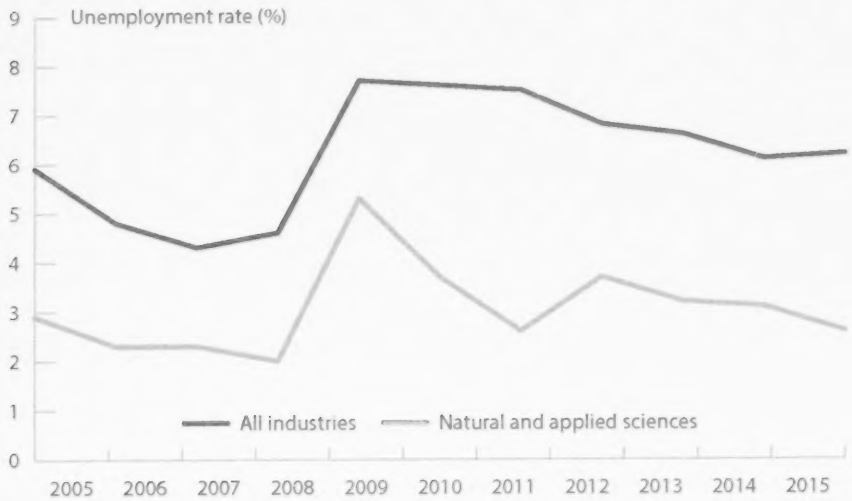
× The ranking compares Vancouver to ten other Canadian cities.

7.1. Unemployment Rate in Natural and Applied Sciences

A low level of unemployment in natural and applied sciences occupations is desirable because some components of this group (e.g., computer scientists) are the engines of innovation in the high technology economy. Higher levels of unemployment in this group indicate idle intellectual capital, which has the effect of slowing the overall rate of innovation. Also, a lower ratio between the unemployment rate for natural and applied sciences occupations and the overall labour force indicates heightened demand for these specializations. This should attract high tech workers from other jurisdictions as well as more students into these disciplines.

Between 2005 and 2015, British Columbia's highest annual rate of unemployment for all occupations occurred in 2009 (7.7%), in the thick of the economic downturn. Over the same period, the highest recorded overall unemployment rate for the nation as a whole was also in 2009 (8.3%). In contrast, the highest rate of unemployment for natural and applied sciences was 5.3% in the province and 4.6% for Canada in the same year. This indicates that, even in times of economic unrest, persons in the natural and applied sciences occupations have enjoyed an employment advantage compared to the labour force as a whole.

INDICATOR L-1: B.C. UNEMPLOYMENT RATE FOR NATURAL AND APPLIED SCIENCE OCCUPATIONS (%)

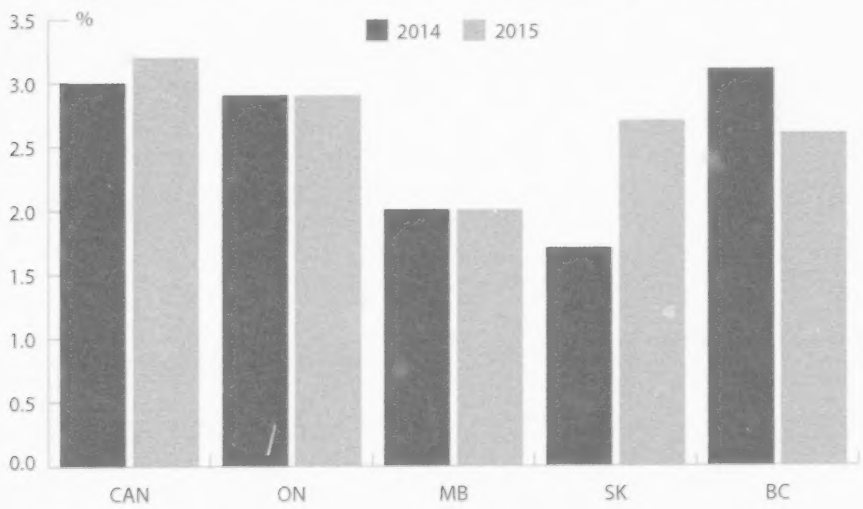


The jobless rates for natural and applied sciences is well below that for all occupations.

Data source: Statistics Canada

In 2015, the unemployment rate for natural and applied sciences in British Columbia was 2.6%, down from 2014 (3.1%) and a half point below the national average (3.2% in 2015). In that year, most provinces saw a decrease in unemployment rates in natural and applied sciences. B.C.'s rate remained below all the provinces in 2015, with the exception of Manitoba (2.0%).

UNEMPLOYMENT RATE FOR NATURAL AND APPLIED SCIENCES, 2014 AND 2015 (%)



In 2015, unemployment rates for natural and applied sciences were lowest in Manitoba.

Data source: Statistics Canada

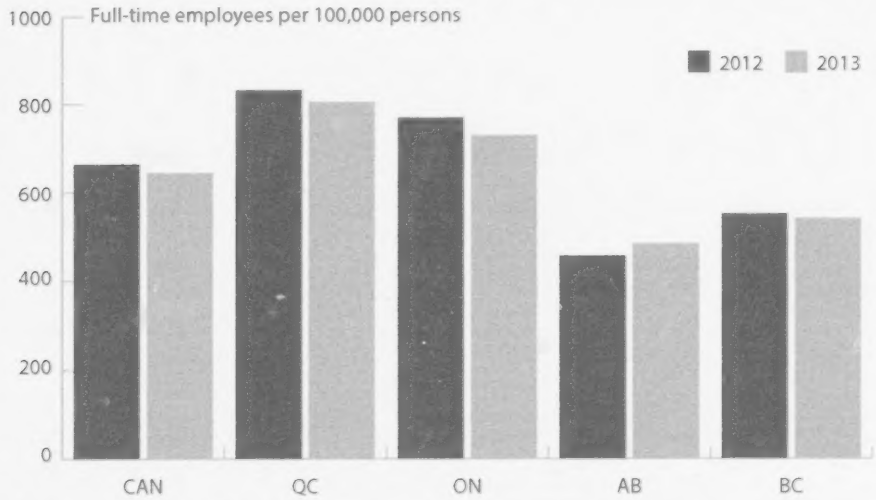
7.2. Research Personnel

The absolute number of researchers and technicians engaged in research is an important determinant of the volume of scientific and technical discoveries that may result in patent applications, and in the birth of new firms or the growth of existing firms. The structure of the research workforce is also important in terms of the employment sector, whether federal government, provincial government, business enterprise or higher education. Each sector has different reasons for developing new technology and different methods of bringing new discoveries to market.

In 2013, there were approximately 226,620 persons working in the areas of government, business and higher education across the country, making for a ratio of 645 researchers per 100,000 persons.

Historically, B.C. trailed the overall Canadian average in terms of researchers per 100,000 population. However, in 2003, British Columbia replaced Alberta as the province with the third-highest proportion of researchers and technicians per 100,000 persons, and has since held onto its standing, behind only Ontario and Quebec. In 2013, British Columbia was home to 24,780 researchers (a 0.9% decrease from 2012), or a per capita research force of 541 per 100,000 persons. In the same year, the research force in Alberta and Saskatchewan surged (+9.4% and +10.3%, respectively), pushing their per capita rates up substantially (485 and 466). Conversely, the research forces in Ontario, Quebec and all of Atlantic Canada saw numbers decline. Despite recent declines, Ontario (730) and Quebec (805) continued to have by far the largest research workforce per 100,000.

INDICATOR L-2: TOTAL RESEARCH WORKFORCE PER 100,000 PERSONS, 2012 AND 2013



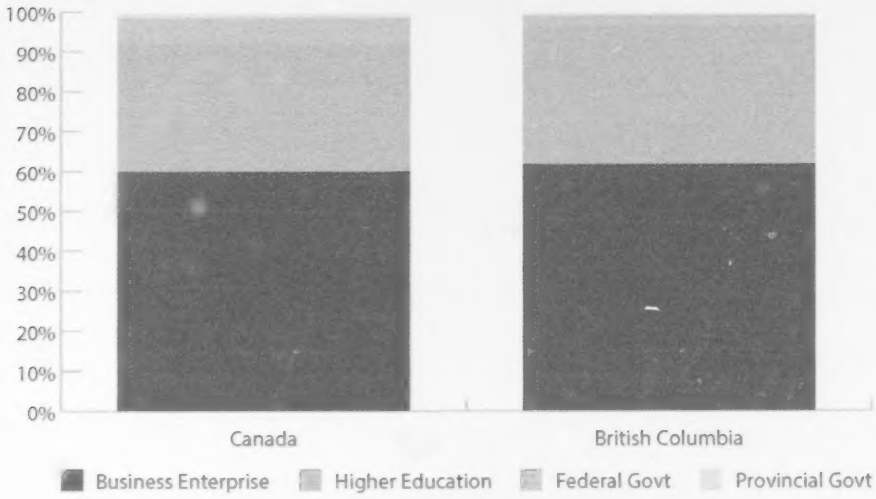
Most provinces with the largest research workforces saw a decline in personnel in 2013.

Data source: Statistics Canada

In 2013, as in previous years, business and higher education claimed the largest shares of Canadian research personnel (62% and 33%, respectively). Business accounted for the largest proportion of the research workforce in most provinces. The proportions ranged from just 32% of personnel in Saskatchewan to over two thirds (67%) in Quebec. In British Columbia, approximately 63% of research personnel were from the business sector.

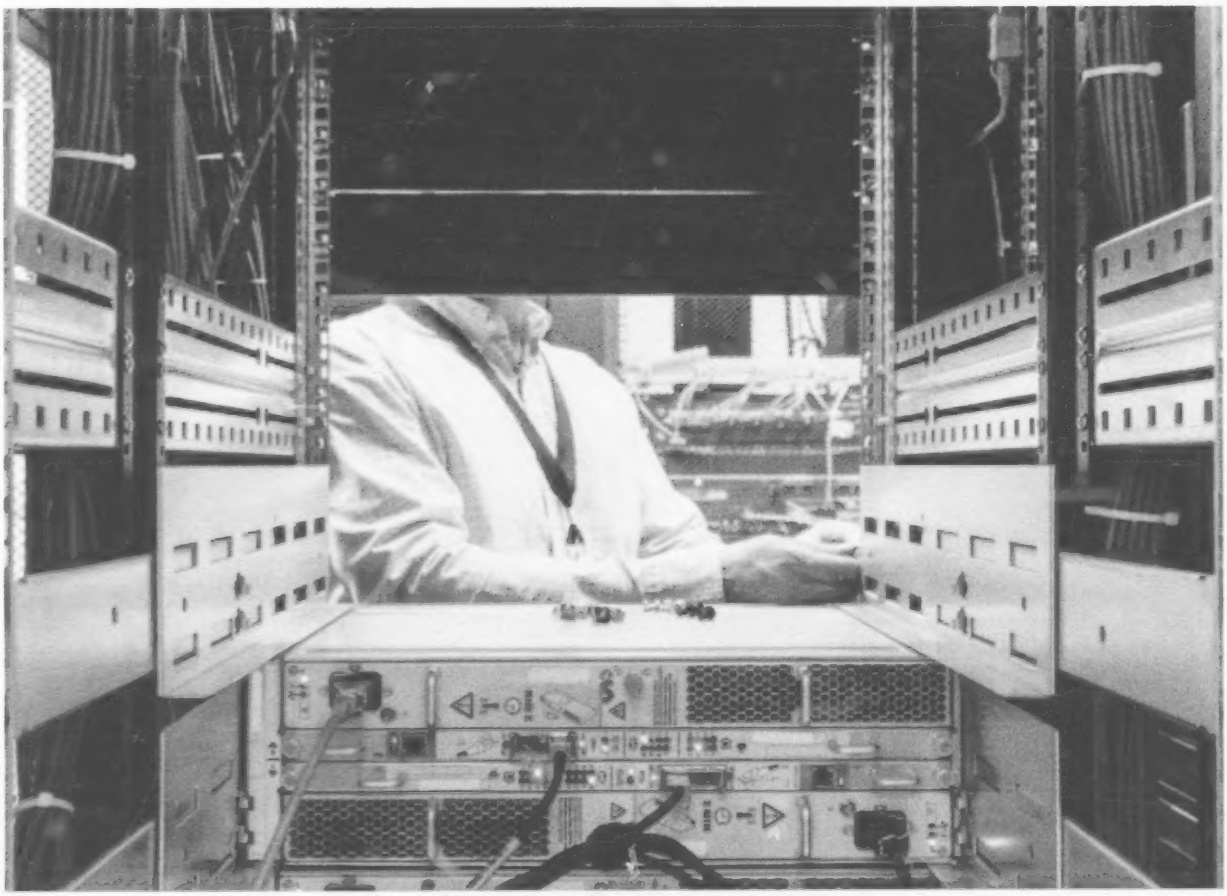
P.E.I., Nova Scotia and Manitoba have a much larger portion of federal research personnel than most provinces, perhaps partly due to the large degree of agricultural research in these provinces. Not surprisingly, due to the concentration of federal agencies in the National Capital Region (Ottawa-Gatineau), Ontario's rate is also somewhat elevated. The proportions of provincial government researchers in Alberta (5%), Saskatchewan (5%) and P.E.I. (6%) are notably higher than the Canadian average (1%). The share of researchers in the higher education sector in B.C. (36%) continues to be above that of Canada as a whole (33%), but is much lower than for the Atlantic Provinces.

STRUCTURE OF THE RESEARCH WORKFORCE BY SECTOR IN 2013



The bulk of B.C.'s research workforce is found in the business sector.

Data source: Statistics Canada



7.3. Quality of Life

Mercer Human Resource Consulting developed "quality of life" scales to assist companies in determining hardship pay. Such allowances are often provided when a company sends employees to work in foreign countries. The Mercer quality of life survey provides rankings based on 39 indicators, grouped into ten categories:

- Political and social environment
- Economic environment
- Socio-cultural environment
- Medical and health considerations
- Schools and education
- Public services and transportation
- Recreation
- Consumer goods
- Housing
- Natural environment

British Columbia's largest city, Vancouver, is consistently ranked as having the highest overall quality of life in North America and among the highest in the world. Granted, B.C. is made up of many diverse regions, cities and towns, but since Vancouver is the most populous metropolitan area in the

province, its high ranking reflects on the province as a whole.[28] Also, most of the quality of life variables are at equally high levels in other parts of the province. The positive ranking for Vancouver holds great potential to provide a substantial competitive advantage in attracting high tech workers.

INDICATOR L-3: QUALITY OF LIFE INDEX RANKING, 2016

	Global Rank	Americas Rank
Vancouver	5	1
Toronto	15	2
Ottawa	17	3
Montreal	23	4
San Francisco	28	5
Calgary	32	6
Boston	34	7
Honolulu	35	8
Chicago	43	9
New York City	44	10
Seattle	46	11

Data source: Mercer Human Resource Consulting

Vancouver consistently ranks first in the Americas on the quality of life scale.

In 2016, Vancouver's score on the overall quality of life index remained well above cities in the other provinces included in the study. On a global scale, Vancouver ranks fifth among 221 cities, far higher than Toronto (15th), Ottawa (17th) Montreal (23rd), and Calgary (32nd). Key American cities with which B.C. competes for high tech workers and firms (particularly Seattle and San Francisco) also rank lower than Vancouver.

[28] The Mercer Human Resource quality of life scales give rankings only to large target urban centres. However, an urban centre's ranking can be quite representative of its surrounding regions.

7.4. Cost of Living

The inter-city price index compares the cost of consumer goods and services in different parts of the country. The "all items" price index is based on a bundle of goods and services that represents the expenditure patterns of a hypothetical average Canadian household. The largest component of the all items index is shelter. This includes the cost of owned or rented housing and related expenses (insurance, electricity, fuel oil, etc.). Prices recorded are the full consumer price, including sales and excise taxes, and are based on a combined city average (100).

The higher quality of life for the province's metropolitan centre comes with a price. In 2015, Vancouver was the second most expensive urban centre in Canada, for both general retail prices and for shelter costs.

With a rate of 104, retail prices in Vancouver were four points higher than the combined city average (100) in 2015, up from 103 in 2014. Vancouver's overall retail price index remained above Ottawa (103), but considerably below Toronto (109). On the other end of the scale, Montreal (94), Charlottetown (95), Saint John (95), Winnipeg (95), St. John's (98) and Regina (99) enjoy lower than average retail prices.

In 2015, Vancouver's costs for shelter were 14 points above the average, the second highest in Canada. In Toronto, shelter costs were an even more substantial 19 points above average. Shelter costs comprise the largest component of the inter-city price index.

INDICATOR L-4: RETAIL PRICES BY MAJOR CITY, 2015

Retail prices in Vancouver are above those of the average metropolitan city in Canada, but lower than those in Toronto.

Note: This index measures only the price differences for a specific basket of goods, which may or may not be representative of the overall cost of living for each specific city.

Data source: Statistics Canada

8. Post-Secondary Outcomes

BC Student Outcomes is an annual survey program that collects information from B.C.'s former post-secondary students. Findings from the surveys provide an understanding of the educational and post-academic experiences of British Columbia's post-secondary students. This information is useful in determining if educational programs are meeting the learning needs of former students of high technology-related programs and of former post-secondary students who hold jobs in the high technology sector.

The Diploma, Associate Degree, and Certificate Student Outcomes (DACSO) Survey is one of the annual surveys in the BC Student Outcomes program. The DACSO Survey asks former students from diploma, associate degree, and certificate programs to evaluate their educational experiences and to talk about their employment and further education. It is conducted 9 to 20 months after students leave their programs. The analysis in this report focuses on graduates from certificate and diploma programs only.[29]

The Baccalaureate Graduates Survey (BGS) is also part of BC Student Outcomes. Since 1996, the BGS has been tracking the outcomes of baccalaureate graduates, both two and five years after graduation. The BGS gathers information on baccalaureate graduates' education satisfaction levels, financing and student debt, further studies, and employment outcomes. BGS data used in this report are from the two-year out survey cycle only.[30]

The surveys are conducted with funding from the Ministry of Advanced Education and participating post-secondary institutions.

---

[29] Throughout this section of the report, 'graduates' is used to refer to former students who graduated from their programs and responded to the survey. It does not refer to all post-secondary graduates. Graduates of four high technology program areas were surveyed by the DACSO Survey: Physical and Life Sciences; Computer and Information Sciences; Engineering and Related Technologies; and Health and Clinical Sciences. Data shown are from 2014, 2015, and 2016.

[30] Three high technology program areas were represented in the BGS: Physical and Life Sciences, Computer and Information Sciences, and Engineering and Related Technologies. Data shown are from 2013, 2014, and 2015.

Respondents to both surveys were asked about their satisfaction with the education they received, the quality of instruction, whether they enrolled in further studies after graduation, and their current activities (studying or working). The survey results also showed the labour force participation rates and unemployment rates for graduates of high technology programs.

For those who were employed, the surveys provided information about the characteristics of their employment, including whether the job was full-time and if it was related to the training they received. Average weekly hours worked and average hourly wages (diploma and certificate) or average annual salary (baccalaureate) were also available. Finally, the top occupations among high technology program graduates were presented, as were the programs from which high technology job holders graduated.

TABLE 7: QUICK SUMMARY OF INDICATORS FOR POST-SECONDARY OUTCOMES

INDICATORS	Trend for Diploma & Certificate Grads		Trend for Baccalaureate Grads		Ranking
	Long-Term	Latest Year	Long-Term	Latest Year	Overall
O-1: Satisfaction with education*		↓			n/a
O-2: Quality of instruction*~					n/a
O-3: Further studies since graduation*			↓		n/a
O-4: In the labour force*					n/a
O-5: Employment rate*				↑	n/a
O-6: Unemployment rate*				↓	n/a
O-7: Knowledge, skills & abilities useful in job*					n/a

INDICATORS	Trend for Diploma & Certificate Grads		Trend for Baccalaureate Grads		Ranking
	Long-Term	Latest Year	Long-Term	Latest Year	Overall
O-8 Employed in high technology occupation≈			↑		n/a
O-9: Job related to training^			↓		n/a
O-10: Full-time employment^				↓	n/a
O-11: Median income (hourly for DACSO, annual for BGS)^	↑		↑	↑	n/a

Post-Secondary Outcomes are from BC Student Outcomes surveys. Note that the surveys are for British Columbia only and, therefore, provincial comparisons are not available. The indicators above are based on five years of respondent data from two surveys: the Baccalaureate Graduates Survey (BGS) and the Diploma, Associate Degree, and Certificate Student Outcomes (DACSO) Survey. Respondent ratings of education are consistently high and any decline showing is modest.

* Respondents who took high technology programs.

~ On the DACSO Survey, quality of instruction was asked using a 5-point scale: very good, good, adequate, poor, and very poor. Percentages presented for DACSO quality of instruction include very good, good, and adequate. On the BGS Survey, quality of instruction was asked using a 4-point scale: very good, good, poor, and very poor. Percentages presented for BGS quality of instruction include very good and good.

≈ Employed in high technology occupation as a percentage of all employed respondents.

^ Of those respondents who indicated they were employed in a high technology occupation.

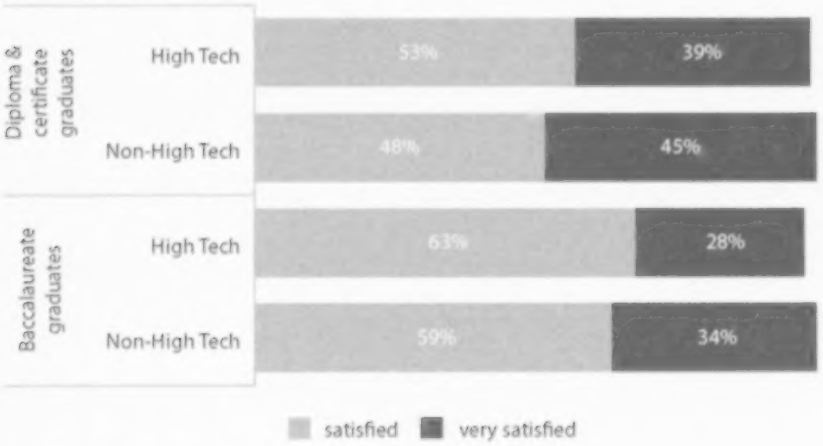
8.1. Education Evaluation

An education in a high technology program area—such as Physical and Life Sciences, Computer and Information Sciences, Engineering and Related Technologies, and Health and Clinical Sciences—provides a skilled workforce ready for employment in high technology industries. Satisfaction with studies and high quality instruction are indicative of programs that prepare graduates well for work in these fields. Continuing studies after graduation indicates additional education is needed or desirable.

A number of the post-secondary educational programs delivered in B.C. fall within the definition of high technology. The high technology programs taken by diploma and certificate respondents have been grouped into four program areas: Physical and Life Sciences, Computer and Information Sciences, Engineering and Related Technologies, and Health and Clinical Sciences. The baccalaureate survey included program graduates from Physical and Life Sciences, Computer and Information Sciences, and Engineering and Related Technologies.

As seen in figure O-1, high technology program graduates reported high levels of satisfaction with their education. Most diploma and certificate (93%) and baccalaureate (91%) high technology program graduates said they were very satisfied or satisfied with their education, comparable with graduates of non-high technology programs.

INDICATOR O-1: SATISFACTION WITH EDUCATION



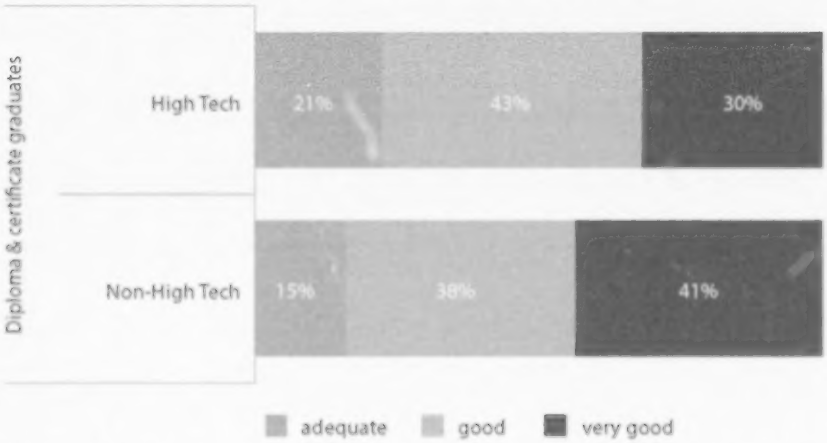
Nearly all graduates were satisfied with their education.

Note: Numbers may not add due to rounding.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

Post-secondary graduates also gave favourable reviews of their course instruction. Most (94%) high technology diploma and certificate graduates said that the quality of the instruction they received was adequate or better, on par with graduates from other programs.

INDICATOR O-2 (A): QUALITY OF INSTRUCTION AMONG DACSO GRADUATES



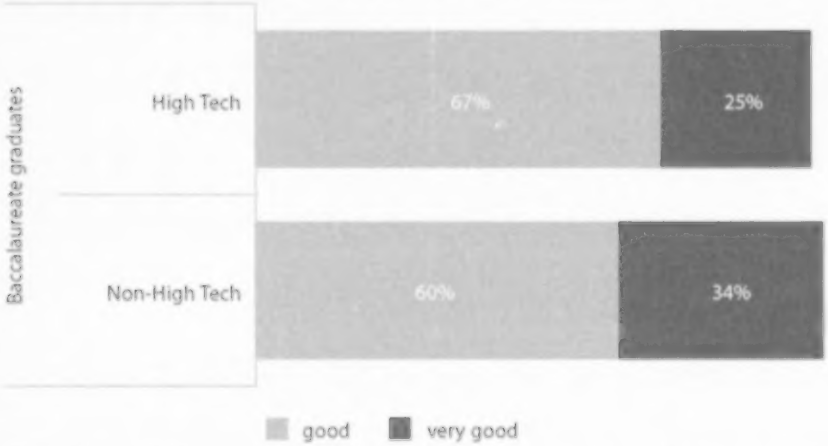
Diploma and certificate graduates were happy with the quality of their instruction.

Note: On the DACSO Survey, quality of instruction was asked using a 5-point scale: very good, good, adequate, poor, and very poor. Percentages presented for DACSO quality of instruction include very good, good, and adequate. Numbers may not add due to rounding.

Data source: BC Student Outcomes, DACSO Survey

As figure O-2 (B) shows, among high technology baccalaureate program graduates, 92% reported that the quality of their instruction was good or better, slightly lower than the percentage of non-high technology graduates (94%).

INDICATOR O-2 (B): QUALITY OF INSTRUCTION AMONG BGS GRADUATES



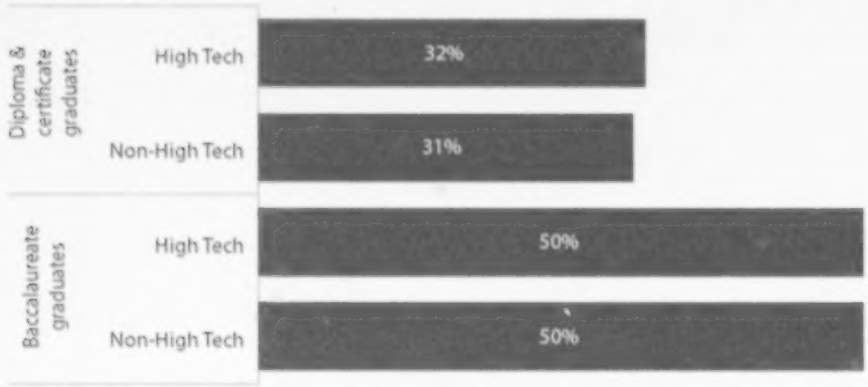
Baccalaureate graduates rated the quality of their instruction highly.

Note: On the BGS Survey, quality of instruction was asked using a 4-point scale: very good, good, poor, and very poor. Percentages presented for BGS quality of instruction include very good and good. Numbers may not add due to rounding.

Data source: BC Student Outcomes, Baccalaureate Graduates Survey

Many graduates, whether from high technology programs or not, continue their education. Figure O-3 illustrates that nearly a third (32%) of diploma and certificate graduates and half of baccalaureate graduates from high technology programs had pursued further studies since graduation.

INDICATOR O-3: FURTHER EDUCATION



Many graduates chose to further their education.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

8.2. Labour Force Outcomes

Participation in the labour force and high employment rates indicate positive employability among high technology program graduates. Unemployment, however, does not necessarily indicate that graduates are not employable. Rather, it may be that the job market favours those with additional training or experience. Receiving the right training is vital and this is corroborated by a majority of graduates reporting that the training they received is useful in the performance of their jobs.

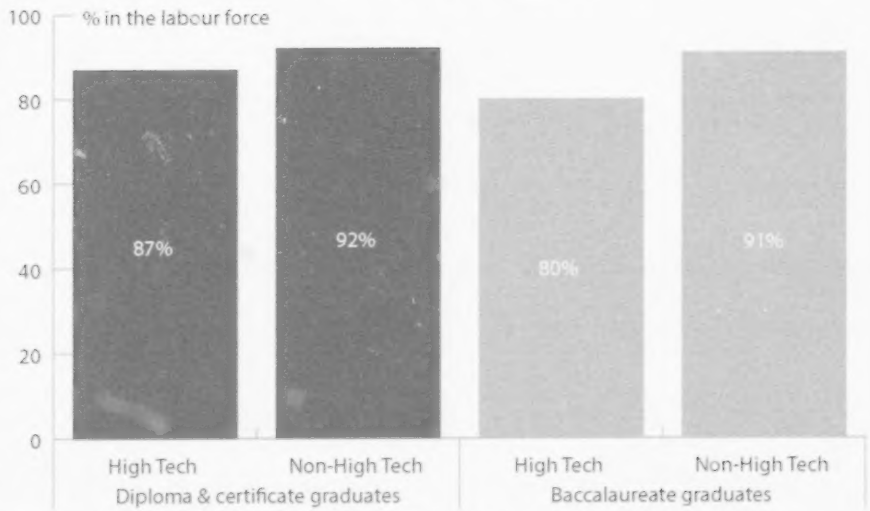
At the time of the survey, the majority of post-secondary program graduates were in the labour force, but some pursued further education instead. This was particularly the case for graduates from baccalaureate programs.

Figure O-4 shows that approximately 9 out of 10 diploma and certificate graduates were in the labour force at the time of the survey—87% of high technology graduates and 92% of non-high technology program graduates.

Among baccalaureate graduates, 80% of high technology graduates and 91% of non-high technology graduates were in the labour force. This disparity is likely due to the fact that over one-fifth (22%) of baccalaureate high technology graduates were engaged solely in studies at the time of the survey, whereas just 9% of graduates from non-high technology disciplines were exclusively dedicated to studying.[31]

[31] Note that some may be looking for work and would therefore be considered in the labour force.

INDICATOR O-4: IN THE LABOUR FORCE POST-GRADUATION

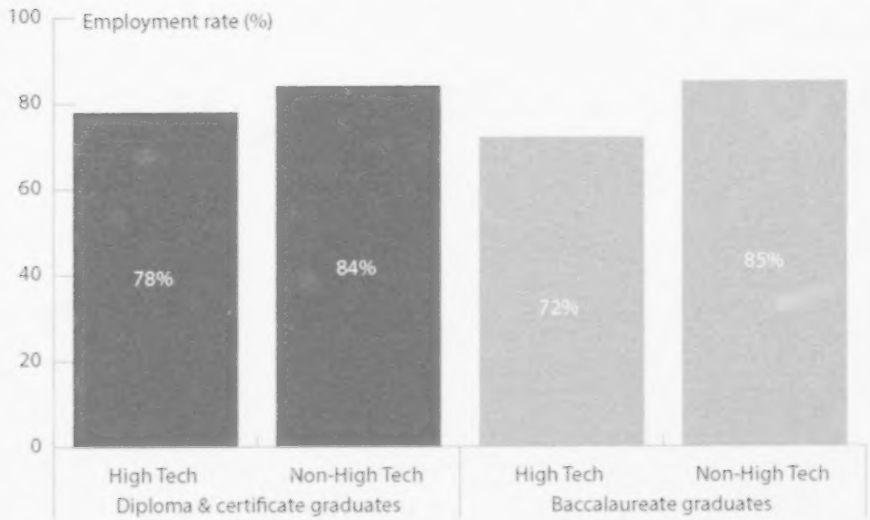


Baccalaureate high technology program graduates were less likely to be in the labour force than their non-high tech counterparts.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

As seen in figure O-5, the employment rate for high technology baccalaureate graduates (72%) was also considerably lower than it was for non-high technology baccalaureate graduates (85%). This too may be due to the group of high technology graduates who are exclusively studying.

INDICATOR O-5: EMPLOYMENT RATES POST-GRADUATION



The employment rate for high technology baccalaureate graduates was affected by their high participation in further education.

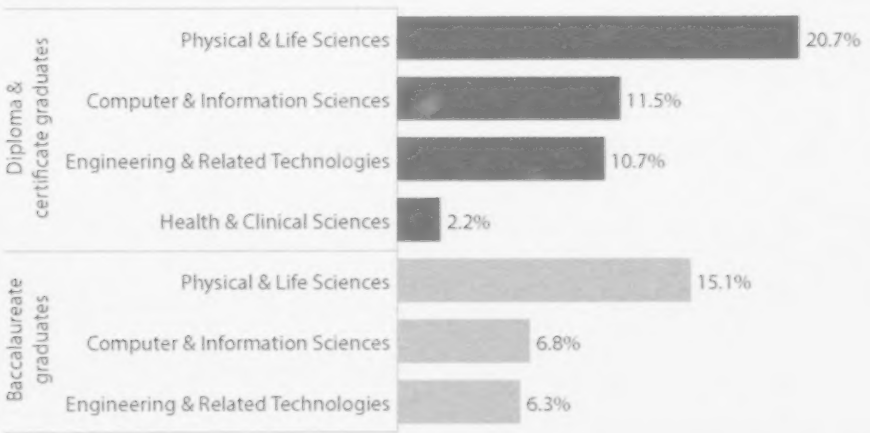
Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

The unemployment rate for diploma and certificate high technology program graduates was 10.0%, while the rate for graduates from other programs was somewhat lower (8.7%). Figure O-6 shows that there was significant variation among the four high technology programs surveyed. For example,

the jobless rate for graduates of Health and Clinical Sciences (2.2%) was notably lower than that for graduates of other high technology programs.

There were also substantial differences in unemployment rates among the three high technology baccalaureate program groups surveyed. The unemployment rate for Physical and Life Sciences graduates (15.1%) was more than double that of graduates from other programs. At the time of the survey, the unemployment rate for high technology baccalaureate graduates overall was 10.0%, compared to 7.1% for BGS graduates from other programs.

INDICATOR O-6: HIGH TECHNOLOGY GRADUATES: UNEMPLOYMENT RATES POST-GRADUATION



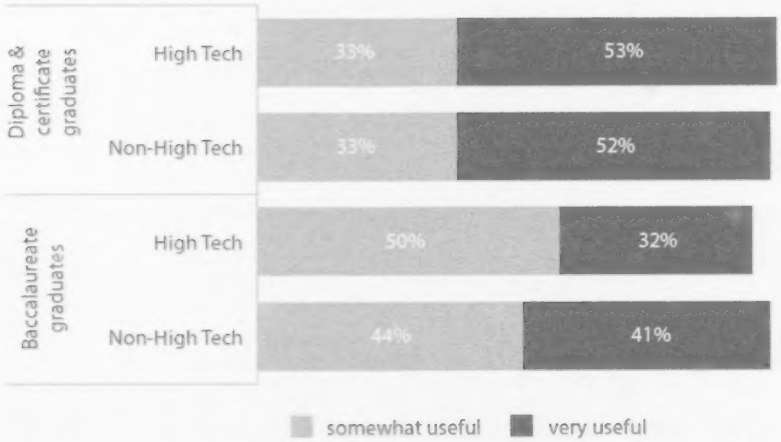
Graduates faced different unemployment rates depending on their field of study.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

As figure O-7 shows, among diploma and certificate graduates, approximately 86% of those from high technology programs and 85% of graduates from other programs reported that their education was useful in the performance of their job. Baccalaureate graduates who had completed high technology programs were somewhat less likely than non-high technology graduates to say that their education was useful in the performance of their job—82% versus 85%.

The fact that most graduates, regardless of the job they held, said that what they learned during their education was useful in the performance of their job suggests that their education had a broad-based utility in the labour market.

IND. ATOR O-7: KNOWLEDGE, SKILLS, AND ABILITIES GAINED DURING EDUCATION USEFUL IN PERFORMANCE OF JOB



All graduates rated their education useful in the performance of their jobs.

Note: Results presented are for employed graduates only. Numbers may not add due to rounding.

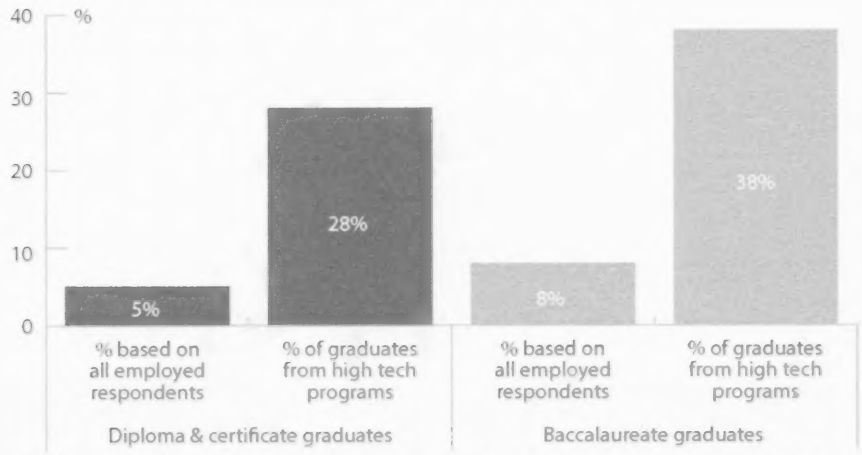
Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

8.3. High Technology Occupations

Employment in a high technology occupation provides graduates from high technology programs with an opportunity to use their newly gained skills and abilities. A relatively low percentage of high-technology program graduates working in high technology occupations may indicate untapped capacity in the work force. High proportions of post-secondary graduates working in jobs they say are related to their education are indicative of a strong high technology workforce.

Overall, the proportion of all graduates employed in high technology occupations is low. Only 5% of employed diploma and certificate graduates and 8% of employed baccalaureate graduates had a high technology occupation. The percentages of those from high technology programs who acquired high technology occupations are higher, of course, but low enough to indicate a large untapped potential, as shown in figure O-8. It could also be that non-high technology occupations, as defined, have significant high-tech components or that useful non-high technology skills were gained from high technology programs.

INDICATOR O-8: EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS



Relatively low proportions of graduates were employed in high technology occupations.

Note: Results presented for graduates who were employed at the time they were surveyed.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

The three most common occupations among high technology job holders with diplomas or certificates were medical technologists and technicians (excluding dental); computer and information systems professionals; and technical occupations in electronics and electrical engineering.

Among baccalaureate graduates, the three most common high technology occupations were computer and information systems professionals; civil, mechanical, electrical and chemical engineers; and other engineers (e.g., computer, geological, or mining engineers).

As seen in table 8, over one-quarter (26%) of diploma and certificate graduates working in high technology occupations came from Engineering and Related Technologies programs, and almost one-quarter (23%) completed programs in Health and Clinical Sciences. Among baccalaureate graduates working in high technology occupations, just under one-third (32%) had degrees from Engineering and Related Technologies programs, and over a quarter (26%) graduated from Computer and Information Sciences programs.

TABLE 8: GRADUATING PROGRAM FOR HIGH TECHNOLOGY JOB HOLDERS

Program of Origin	Diploma & Certificate High Technology Job Holders Percent	Baccalaureate High Technology Job Holders Percent
Health and Clinical Sciences	23%	n/a
Engineering and Related Technologies	26%	32%
Computer and Information Sciences	15%	26%
Physical and Life Sciences	3%	19%
Non-High Technology	34%	23%

Note: Results presented are for those graduates who were employed in high technology occupations at the time they were surveyed. Numbers may not add due to rounding.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

Looking deeper at the top three high technology occupations held by graduates, there was a fairly high degree of correspondence between occupation and high technology program area (see tables 9 and 10). Indeed, among baccalaureate graduates, almost all (94%) civil, mechanical, and chemical engineers completed programs in Engineering and Related Technologies. A majority (68%) of diploma and certificate graduates who worked in electronics and electrical engineering completed Engineering and Related Technologies programs.

TABLE 9: DACSO PROGRAM OF ORIGIN FOR TOP 3 HIGH TECHNOLOGY OCCUPATIONS

Program of Origin	Medical Technologists and Technicians (excl. dental)	Computer and Information Systems Professionals	Technical Occupations in Electronics and Electrical Engineering
Health and Clinical Sciences	59%	0%	0%
Engineering and Related Technologies	0%	36%	68%
Computer and Information Sciences	0%	37%	0%
Physical and Life Sciences	1%	0%	0%
Non-High Technology	39%	27%	32%

Note: Results presented are for those graduates who were employed in high technology occupations at the time they were surveyed. Numbers may not add due to rounding.

Data source: BC Student Outcomes, DASCO Survey

TABLE 10: BGS PROGRAM OF ORIGIN FOR TOP 3 HIGH TECHNOLOGY OCCUPATIONS

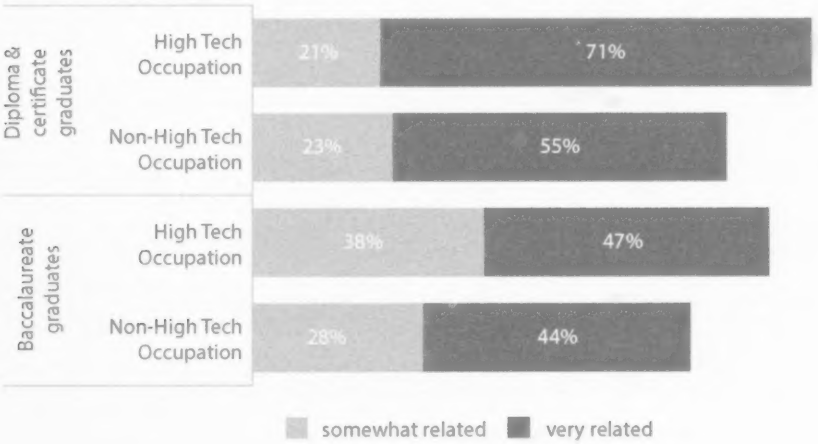
Program of Origin	Computer and Information Systems Professionals	Civil, Mechanical, Electrical and Chemical Engineers	Other Engineers
Engineering and Related Technologies	24%	94%	81%
Computer and Information Sciences	49%	0%	9%
Physical and Life Sciences	4%	3%	1%
Non-High Technology	23%	3%	9%

Note: Results presented are for those graduates who were employed in high technology occupations at the time they were surveyed. Numbers may not add due to rounding.

Data source: BC Student Outcomes, Baccalaureate Graduates Survey

Most (92%) diploma and certificate graduates and a large majority (85%) of baccalaureate graduates who had high technology occupations said their job was very or somewhat related to their education. Further, they were significantly more likely to say their education and job were related than were graduates employed in non-high technology occupations; another indication that post-secondary programs provide skills and knowledge particularly suited to the high technology sector.

INDICATOR O-9: TRAINING-RELATED JOB HELD BY DIPLOMA, CERTIFICATE, AND BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS



Most graduates were working in jobs that were related to the training they received.

Note: Results presented are for those graduates who were employed at the time they were surveyed. Numbers may not add due to rounding.

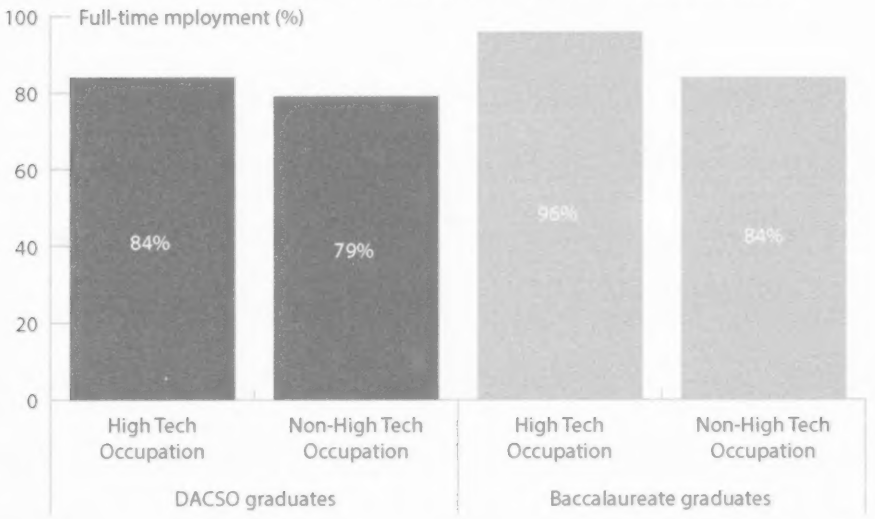
Data source: BC Student Outcomes, DASCO Survey and Baccalaureate Graduates Survey

8.4. Employment Characteristics

The proportion of post-secondary graduates employed full-time in high technology occupations points to availability of work in these areas. The wages received by post-secondary graduates employed in high technology occupations indicate the demand for these jobs and the economic impact they have.

Graduates employed in high technology occupations were more likely than those working in non-high technology occupations to be employed full-time (working at least 30 hours per week). Approximately 84% of high technology diploma and certificate graduates were employed full-time in their main job, compared to 79% of non-high technology graduates. The comparable figures for baccalaureate graduates were 96% and 84%, respectively.

INDICATOR O-10: FULL-TIME EMPLOYMENT OF DIPLOMA, CERTIFICATE, AND BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS



Graduates in high technology occupations were more likely to hold full-time jobs than non-high technology workers.

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job.

Data source: BC Student Outcomes, DACSO Survey and Baccalaureate Graduates Survey

As seen in tables O-11 (A) and (B), graduates employed in high technology occupations also earned higher wages than those in non-high technology jobs. Diploma and certificate graduates who had full-time high technology occupations earned a median hourly wage of $25 in their main job, compared to $20 for their counterparts in non-high technology occupations. Similarly, the median annual income among baccalaureate graduates employed full-time in high technology jobs was $60,000, while those who did not hold high technology jobs, earned a median annual income of $49,200.

For diploma and certificate graduates employed in one of the top three high technology occupations, those who held positions as medical technologists and technicians (excluding dental) reported the highest median hourly wage ($27) from their main job. For baccalaureate graduates employed in one of the top three high technology occupations, those who were other engineers (e.g., computer, geological, or mining engineers) had the highest median annual income ($74,000) from their main job.

INDICATOR O-11 (A): INCOME FOR DACSO GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

	Median Hourly Wage
Not employed in High Technology Occupations	$20
Employed in High Technology Occupations	$25
Top 3 High Technology Occupations:	
Medical Technologists and Technicians (excl. Dental)	$27
Computer and Information Systems Professionals	$24
Technical Occupations in Electronics and Electrical Engineering	$22

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job.
Data source: BC Student Outcomes, DACSO Survey

INDICATOR O-11 (B): INCOME FOR BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

	Median Annual Income
Not employed in High Technology Occupations	$49,200
Employed in High Technology Occupations	$60,000
Top 3 High Technology Occupations:	
Other Engineers (e.g., computer, geological, or mining engineers)	$74,000
Civil, Mechanical, Electrical, and Chemical Engineers	$65,000
Computer and Information Systems Professionals	$61,000

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job.

Data source: BC Student Outcomes, Baccalaureate Graduates Survey

9. Conclusion

Relative to other parts of Canada, British Columbia compares reasonably well with regard to providing an environment that will attract high technology businesses.

In terms of educational attainment, the province has experienced an overall upward trend in most areas. B.C. leads the country in technology adoption and the province's top university (UBC) continues to outperform most of the nation's other U-15 institutions in licensing, patents and start-up companies. Conversely, there remains room for improvement in some of the performance indicators, particularly in higher education performance of R&D.

Compared to other Canadian provinces, British Columbia returns above average ratings in about half of the business stimulus indicators, and there have also been some positive developments in recent years. In the most recent reporting year, B.C. maintained a solid ranking of third among the provinces in the ratio of research and development (R&D) performance by business to provincial GDP. Despite scoring below average on some other business stimulus indicators, such as patents awarded per capita, the province shows signs of strength with long-term growth in the number of high technology businesses and leads the country in venture capital investment per capita.

With the exception of performance of R&D, the province's government sector ranks relatively well compared to other provinces, particularly with regard to its comparatively low tax rates for business.

The province's immigrant population is well educated, but overall immigrant education levels lag other provinces, especially in recent years. However, B.C. appears to be expanding its general labour pool substantially, ranking first in the country in net interprovincial migration in 2016. High tech imports have been climbing steadily, indicating that the industry is strengthening.

Unemployment rates among workers in the natural and applied sciences in B.C. have declined substantially in recent years and sit notably lower than the national average. In the latest reporting year, British Columbia maintained a third place ranking in terms of researchers per 100,000 population. Vancouver, B.C.'s largest city, continuously ranks among the most desirable places to live in the world, despite its comparably high cost of living.

Graduates from high technology-related disciplines are generally satisfied with their education and find their studies useful in the workplace. Most of these graduates are successful at finding full-time employment in fields related to their education.

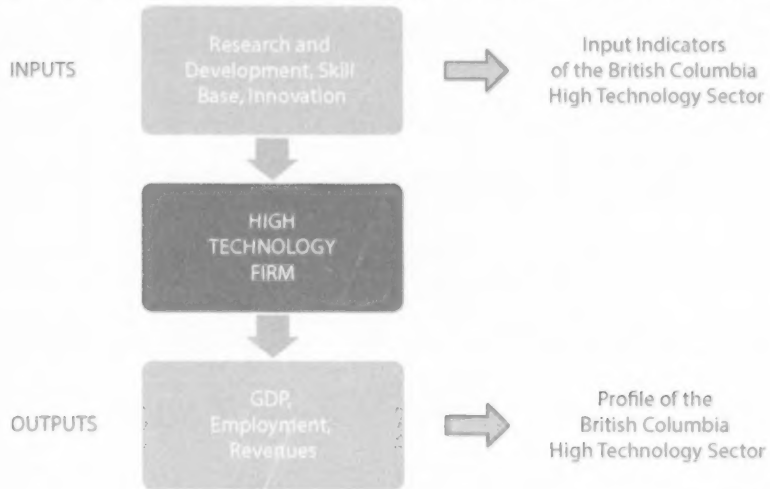
Given the importance of the high technology sector in today's global community, along with the potential for boosting business and employment in the province, the environment that B.C. provides is of high significance. A continuing effort to ensure that the province maintains the right environment to attract high technology businesses will give B.C.'s tech sector the support it needs to continue to thrive.

10. Appendix I: BC Stats' Sector Model

In BC Stats' model of the high technology sector (see section 10.2. "Modeling the High Technology Sector"), the firm is the centre of the system of high technology production. The firm receives inputs, in the form of labour, physical and financial capital, raw materials and parts, and knowledge. Knowledge may be embodied in labour (human capital) or other inputs, or it may come in the form of patents and copyrights, books and electronic information, etc. Through its internal operations, the firm then produces outputs. These outputs are products and services, and (in some views) also include employment and other benefits to society.

This firm-centred view underlies BC Stats' publication strategy for high technology sector information, as shown in the diagram below.

FIGURE 1: BC STATS' PRODUCTS FOR MONITORING THE HIGH TECHNOLOGY SECTOR



INPUTS
Research and Development, Skill Base, Innovation
Input Indicators of the British Columbia High Technology Sector
HIGH TECHNOLOGY FIRM
OUTPUTS
GDP, Employment, Revenues
Profile of the British Columbia High Technology Sector

10.1. What is an Indicator?

The concept of indicators is well understood in the operation of machines. For instance, the dashboard of a car has many indicators. The speedometer measures the main output, which is forward motion. However, gauges such as oil pressure and water temperature assess how well the engine is working as a system. They predict the engine's future performance, and may suggest the need for specific adjustments.

Predicting the future, in terms of the economy, requires an examination of the chain of events that lead to the production of specific outputs and the development of indicators for those steps in the chain judged to be most important. Similarly, predicting the future of the high technology sector requires developing a model of what drives growth in the sector, and then obtaining indicators for each component of the model.

In selecting indicators, consideration must be given not only to their place in a growth model of the high technology sector, but also to their accuracy and availability. Indicators should meet other tests as well. In the annual (since 1997) Index of the Massachusetts Innovation Economy,[32] all potential indicators are subject to a set of five criteria. The indicators selected for inclusion in the report are:

- derived from objective and reliable data sources,
- statistically measurable on an ongoing basis,
- bellwethers that reflect the fundamentals of economic vitality,
- understood and accepted by the community, and
- measurements of conditions in which there is an active public interest.

These criteria help ensure that the indicators become relevant to politicians and citizens as well as to statisticians, and have thus been adopted for this report as well.

[32] Massachusetts Technology's 2015/16 edition of the annual *Index of the Massachusetts Innovation Economy* is available at: http://www.masstech.org/research-and-analysis/innovation-index

10.2. Modeling the High Technology Sector

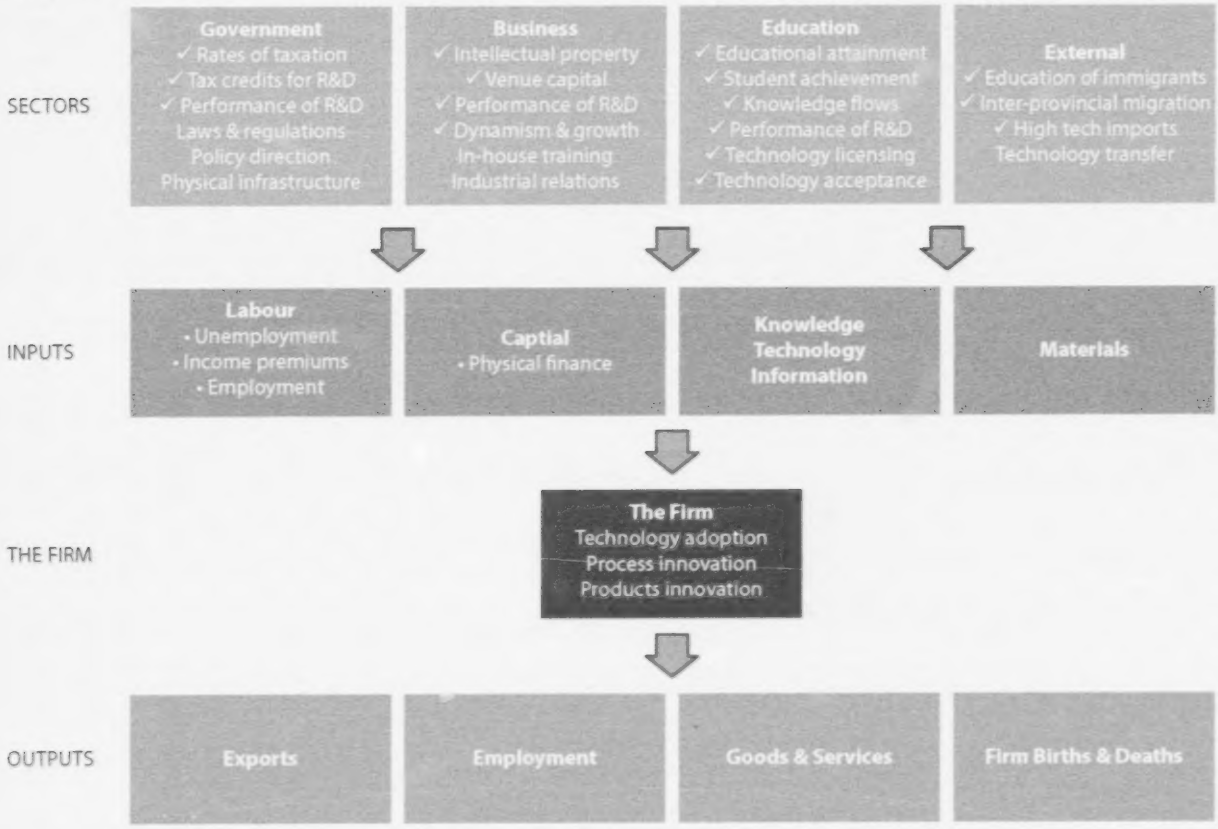
In 1998, BC Stats, the Information, Science and Technology Agency of British Columbia, and the Science Council of British Columbia began a collaboration to devise a model of the B.C. high technology sector, with an associated set of indicators. This resulted in two working papers. The first reviewed definitions of the high technology sector and models of the innovation economy in other jurisdictions, while the second proposed a model for use in B.C., together with a large number of potential indicators for that model.[33] Subsequently, BC Stats has simplified the model and prepared a corresponding shorter list of indicators. The simplified model and indicators form the basis for this publication.

The traditional model of economic production focuses on land, labour and capital, which are the "factors of production" or inputs into the production process. These factors are transformed by firms, other organizations, or individuals into valued goods and services. GDP is the main measure of that value and is the most common statistic used to describe the production of economic sectors. This traditional model can be thought of as an input/output view of the economy. The inputs are obtained from a variety of sources and enter a production process, resulting in outputs.[34]

[33] Koebberling, Uschi and Veneranda Dettmers, "A Model of the BC High Technology Sector: Description of Factors and Linkages Affecting the Growth of the High Technology Sector in the Context of an Innovation Economy," Science Council of BC, April 1999. Available at www.llbc.leg.bc.ca/public/pubdocs/bcdocs/358283/high_technology.pdf

[34] This is also referred to as the neoclassical model. See Lipsey, Richard G. and Kenneth Carlaw, "A Structuralist Assessment of Technology Policies—Taking Schumpeter Seriously on Policy," Working Paper #25, Industry Canada, Research Publications Program, October 1998. Available at www.ic.gc.ca/eic/site/eas-aes.nsf/eng/ra01700.html

FIGURE 2: MODEL OF THE HIGH TECHNOLOGY SECTOR



The advent of the "information economy" has added a new dimension to traditional economic production, and some efforts to describe it seem quite new as well. However, the input/output view can readily be adapted to the information economy. In the model above, the firm is at the centre of the productive system. As in the traditional model, the firm receives inputs; however, knowledge, technology and information are distinguished as a unique category. This can include patents and copyrights, software, information on production methods, etc. In addition, it is recognized that the other factors—labour, capital and materials—each have critical and increasing quantities of knowledge embodied in them.

The diagram then looks beyond the production inputs, to analyze their sources (the top row of boxes). For example, skilled labour may come from training courses in educational institutions, from in-house training, or from other provinces or countries. The sources for the inputs have been categorized as four "sectors." Within each sector, particular areas that bear on the production inputs are identified. These areas are the ones for which indicator variables have been sought out. The areas listed in bold, and checked, are the ones for which data are available and have been collected by BC Stats.

While the indicator variables have normally been sought out at the level of the source sectors, certain labour indicators, such as the unemployment rate, are not attributable to a single source sector. Such indicators have been grouped in a separate "Labour" section.

Once the inputs are obtained by the firm, they are transformed in a way that depends on the firm's many characteristics. Some of the characteristics of most importance for high technology firms are listed within the "The Firm" box in the diagram. [35]

Finally, the firm produces and sells goods and services, some of which are consumed locally, while the remainder are exported, as depicted in the bottom row. It should be recognized that even with a simplified model such as the one set out here, it is possible to imagine a large number of interactions. That is, almost every box or element within the boxes could be joined by an arrow to every other box or element. In turn, a complete statistical system based on the model would track the flows of people, dollars or information along each of the pathways (arrows). Such a comprehensive approach is neither practical, nor would it necessarily lead to greater understanding and better policy. However, statistics are available on a significant number of the interactions, providing a strong source for future research.

[35] For an in-depth study of uses of knowledge within high technology firms, see Canada's 2002 Innovation Strategy reports: Knowledge Matters: Skills and Learning for Canadians and Achieving Excellence: Investing in People, Knowledge and Opportunity available at http://publications.gc.ca/site/eng/108190/publication.html and Schuetze, Hans, Innovation, Skills, and Learning: A Study of Knowledge and Human Resources Management in Small and Medium Sized Enterprises in British Columbia, Centre for Policy Studies in Education, University of British Columbia, March 1998.

11. Appendix II: Definitions of the High Technology Sector

The table below describes the North American Industry Classification System-based definition of the High Tech Sector in British Columbia. This is the most recent definition developed to describe B.C.'s high technology sector. More detail on the industries and why they are included can be found in Profile of the British Columbia High Technology Sector, which is available at: www.bcstats.gov.bc.ca

TABLE 11: INDUSTRIES IN THE HIGH TECHNOLOGY SECTOR

NAICS	Industry Description
	Manufacturing Industries
325189	Other Inorganic Chemicals
325410	Pharmaceutical and Medicine
333310	Commercial and Service Industry
334110	Computer and Peripheral
334210	Telephone Apparatus
334220	Radio, Television Broadcasting & Wireless Communications Equipment
334290	Other Communications Equipment
334310	Audio and Video Equipment
334410	Semiconductor and Other Electronic Components
334511	Navigational and Guidance Instruments
334512	Measuring, Medical and Controlling Devices
334610	Manufacturing and Reproducing Magnetic and Optical Media
335315	Switchgear and Switchboard, and Relay and Industrial Control Apparatus
335920	Communication and Energy Wire and Cable

NAICS	Industry Description
335990	All Other Electrical Equipment and Component
336410	Aerospace Products and Parts
339110	Medical Equipment and Supplies
	Service Industries
511211	Software Publishers (Except Video Game Publishers)
511212	Video Game Publishers
512110	Motion Picture and Video Production
512190	Post-Production and Other Motion Picture and Video Industries
515210	Pay and Specialty Television
517111	Wired Telecommunications Carriers (Except Cable)
517112	Cable and Other Program Distribution
517210	Wireless Telecommunications Carriers (Except Satellite)
517410	Satellite Telecommunications
517910	Other Telecommunications

Notes for Indicators E-4 through E-8:

As of 2009, the college graduate counts are based on the calendar year to align with how university graduates are reported. For years prior to 2009, college graduate counts were based on an academic year. Due to the transition, some graduates reported in 2009 may have also been reported in 2008.

From 2005 to 2008, figures for the graduates from the University of Regina are not available and are therefore not included in the counts for Saskatchewan.

INDICATORS O-1, O-2, O-3 AND O-4 (A). EDUCATION EVALUATION BY DIPLOMA AND CERTIFICATE GRADUATES OF HIGH TECHNOLOGY PROGRAMS

Characteristics	Physical & Life Sciences	Computer & Information Sciences	Engineering & Related Technologies	Health & Clinical Sciences
Satisfaction with education	98%	90%	93%	94%
Quality of instruction	99%	93%	94%	93%
Further studies since graduation	51%	27%	36%	23%

Note: In the DACSO Survey, respondents were asked to rate quality of instruction using a 5-point scale: very good, good, adequate, poor, and very poor. Percentages presented for DACSO quality of instruction include the response categories: very good, good, and adequate.
Source: BC Student Outcomes, DACSO Survey

INDICATORS O-1, O-2, O3 AND O-4 (B). EDUCATION EVALUATION BY BACCALAUREATE GRADUATES OF HIGH TECHNOLOGY PROGRAMS

Characteristics	Physical & Life Sciences	Computer & Information Sciences	Engineering & Related Technologies
Satisfaction with education	91%	91%	92%
Quality of instruction	93%	90%	90%
Further studies since graduation	70%	34%	29%

Note: In the BGS Survey, respondents were asked to rate quality of instruction using a 4-point scale: very good, good, poor, and very poor. Percentages presented for BGS quality of instruction include two response categories: very good and good.
Source: BC Student Outcomes, Baccalaureate Graduates Survey

INDICATORS O-4, O-5, O-6 AND O-7 (A). LABOUR FORCE OUTCOMES OF DIPLOMA AND CERTIFICATE GRADUATES OF HIGH TECHNOLOGY PROGRAMS

Characteristics	Physical & Life Sciences	Computer & Information Sciences	Engineering & Related Technologies	Health & Clinical Sciences
Labour force participation rate	71%	95%	83%	97%
Employment rate	55%	83%	73%	94%
Unemployment rate	20.7%	11.5%	10.7%	2.2%
Knowledge & skills learned useful performing job*	82%	84%	85%	93%

* Results presented are for employed graduates only.
Source: BC Student Outcomes, DACSO Survey

INDICATORS O-4, O-5, O-6 AND O-7 (B). LABOUR FORCE OUTCOMES OF BACCALAUREATE GRADUATES OF HIGH TECHNOLOGY PROGRAMS

Characteristics	Physical & Life Sciences	Computer & Information Sciences	Engineering & Related Technologies
Labour force participation rate	67%	89%	93%
Employment rate	57%	83%	87%
Unemployment rate	15.1%	6.8%	6.3%
Knowledge & skills learned useful performing job*	73%	87%	88%

* Results presented are for employed graduates only.

INDICATOR O-9 (A): TRAINING-RELATED JOB HELD BY DIPLOMA AND CERTIFICATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

Program	Job Related to Training
Non-High Tech Program	**87%**
Physical and Life Sciences	89%
Computer and Information Sciences	96%
Engineering and Related Technologies	92%
Health and Clinical Sciences	99%

Results presented are for respondents employed in high-technology occupations.

Source: BC Student Outcomes, DACSO Survey

INDICATOR O-9 (B): TRAINING-RELATED JOB HELD BY BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

Program	Job Related to Training
Non-High Tech Program	**71%**
Physical and Life Sciences	85%
Computer and Information Sciences	94%
Engineering and Related Technologies	87%

Results presented are for respondents employed in high-technology occupations.

Source: BC Student Outcomes, Baccalaureate Graduates Survey

INDICATOR O-10 (A): FULL-TIME EMPLOYMENT OF DIPLOMA AND CERTIFICATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

Occupation	Employed Full-Time
Not employed in High Technology Occupations	79%
Employed in High Technology Occupations	84%
Top 3 High Technology Occupations:	
Technical Occupations in Electronics and Electrical Engineering	98%
Computer and Information Systems Professionals	93%
Medical Technologists and Technicians (excl. Dental)	68%

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job
Source: BC Student Outcomes, DACSO Survey

INDICATOR O-10 (B): FULL-TIME EMPLOYMENT OF BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

Occupation	Employed Full-Time
Not employed in High Technology Occupations	84%
Employed in High Technology Occupations	96%
Top 3 High Technology Occupations:	
Civil, Mechanical, Electrical, and Chemical Engineers	99%
Other Engineers (e.g., computer, geological, or mining engineers)	98%
Computer and Information Systems Professionals	97%

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job
Source: BC Student Outcomes, Baccalaureate Graduates Survey

INDICATOR O-11 (A). INCOME FOR DACSO GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

	Median Hourly Wage
Not employed in High Technology Occupations	$20
Employed in High Technology Occupations	$25
Top 3 High Technology Occupations:	
Medical Technologists and Technicians (excl. Dental)	$27
Computer and Information Systems Professionals	$24
Technical Occupations in Electronics and Electrical Engineering	$22

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job
Source: BC Student Outcomes, DACSO Survey

INDICATOR O-11 (B). INCOME FOR BACCALAUREATE GRADUATES EMPLOYED IN HIGH TECHNOLOGY OCCUPATIONS

	Median Annual Income
Not employed in High Technology Occupations	$49,200
Employed in High Technology Occupations	$60,000
Top 3 High Technology Occupations:	
Other Engineers (e.g., computer, geological, or mining engineers)	$74,000
Civil, Mechanical, Electrical, and Chemical Engineers	$65,000
Computer and Information Systems Professionals	$61,000

Note: Results presented are for those graduates who were employed at the time they were surveyed; reported for main job

BCStats

BC Stats is the provincial government's leader in statistical and economic research, information and analysis essential for evidence-based decision-making. BC Stats, the central statistics agency of government, is excited to be taking a lead role in the strategic understanding of data sources and analysis across government. The goal is to increase overall business intelligence—information decision makers can use. As part of this goal, BC Stats is also developing an organizational performance measurement program. For more information, please contact Elizabeth Vickery.
